Chapter 1. Cosmic Ray Interactions in Space Plasmas	1
1.1. Main properties of space plasma	1
1.1.1. Neutrality of space plasma and Debye radius	1
1.1.2. Conductivity and magnetic viscosity of space plasma	1
1.1.3. The time of magnetic fields dissipation; frozen magnetic fields	1
1.1.4. Transport path of ions in space plasma	2
1.1.5. Space plasma as excited magneto-turbulent plasma	2
1.1.6. Main channels of energy transformation in space plasma	2
1.1.7. Particle acceleration in space plasma and the second fundamental law of thermodynamics	3
1.2. Main properties and origin of CR	4
1.2.1. Internal and external CR of different origin	4
1.2.2. On the main properties of primary and secondary CR	4
1.2.3. Five intervals in the observed CR energy spectrum	5
1.2.4. Main CR properties and origin of CR in the interval 1	7
1.2.5. The anisotropy in energy intervals 1 and 2	7
1.2.6. Relationships between the observed CR spectrum, the anisotropy, the relative content of the daughter nuclei, and the transport scattering path	9
1.2.7. Chemical composition in the 10^9 eV/nucleon $\leq E_k \leq 3 \times 10^{11}$ eV/nucleon range and the expected dependence of $\Lambda_G(E_k)$ and $A_{sid}(E_k)$ on E_k	11
1.2.8. Chemical composition in the 3×10^7 eV/nucleon $\leq E_k \leq 10^9$ eV/nucleon energy range and the nature of the scattering elements in the Galaxy	11
1.2.9. The nature of the energy boundary between intervals 3 and 2	12
1.2.10. The mode of the dependence of Λ on particle rigidity R from solar modulation data of protons, electrons, and nuclei with various Z	13
1.2.11. The dependence of Λ on E_k from data of solar CR propagation	15
1.2.12. The features of the solar modulation of the CR spectrum and the measurements of the radial gradient	16
1.2.13. The nature of the CR in energy intervals 3 - 5	16
1.3. Nuclear interactions of CR with space plasma matter	16
1.3.1. Cross sections, paths for absorption, and life time of CR particles relative to nuclear interactions in space plasma	16
1.3.2. CR fragmentation in space plasma	17
1.3.3. Expected fluxes of secondary electrons, positrons, γ - quanta, and neutrinos	19
1.3.4. Expected fluxes of secondary protons and antiprotons	22
1.4. CR absorption by solid state matter (stars, planets, asteroids, meteorites, dust) and secondary CR albedo	22
1.5. CR interactions with electrons of space plasma and ionization losses	23
1.5.1. Ionization energy losses by CR nuclei during propagation in the space	23
1.5.2. Ionization and bremsstrahlung losses for CR electrons	25
1.6. CR interactions with photons in space	26
1.6.1. Interactions of CR nucleus with space photons	26
1.6.2. CR electron interactions with the photon field	27
1.7. Energy variations of CR particles in their interactions with magnetic fields	27
1.7.1. Synchrotron losses of energy by CR particles in magnetic fields	27
1.7.2. Acceleration and deceleration of particles in their interactions with moving magnetic fields	29

viii **Lev Dorman** *Cosmic Ray Interactions, Propagation, and Acceleration in Space Plasmas*

1.8. CR particle motion in magnetic fields; scattering by magnetic inhomogeneities	30
1.8.1. CR particle motion in the regular magnetic fields frozen into moving plasma formations	30
1.8.2. CR particle moving in essentially inhomogeneous magnetized plasma	31
1.8.3. Two-dimensional model of CR particle scattering by magnetic inhomogeneities of type $\mathbf{H} = (0,0,H)$	32
1.8.4. Scattering by cylindrical fibers with homogeneous field	32
1.8.5. Scattering by cylindrical fibers with field of type $h = M/r^n$	33
1.8.6. Three-dimensional model of scattering by inhomogeneities of the type $\mathbf{h} = (0,h(x),0)$ against the background of general field $\mathbf{H}_0 = (H_0,0,0)$	35
1.9. The transport path of CR particles in space magnetic fields	38
1.9.1. The transport path of scattering by magnetic inhomogeneities of the type of isolated magnetic clouds of the same scale	38
1.9.2. Transport scattering path in case of several scales of magnetic inhomogeneities	39
1.9.3. The transport scattering path in the presence of a continuous spectrum of the cloud-type of magnetic inhomogeneities	41
1.9.4. Transport path in a plane perpendicular to cylindrical fibers with a homogeneous field	45
1.9.5. Transport path of scattering by cylindrical fibers with field $h = M/r^n$ in the two-dimensional case	47
1.9.6. The transport path in the three-dimensional case of scattering by the fields of the type $h = M/r^n$	47
1.9.7. Transport path of scattering by inhomogeneities of the type $h = (0,h(x),0)$ against the background of the regular field $H_0 = (H_0,0,0)$	48
1.9.8. The transport scattering path including the drift in inhomogeneous fields	52
1.9.9. The transport scattering path in the presence of the regular background field	53
1.9.10. The transport path for scattering with anisotropic distribution of magnetic inhomogeneities in space	56
1.10. Magnetic traps of CR in space	57
1.10.1. Types of CR magnetic traps and main properties	57
1.10.2. Traps of cylindrical geometry with a homogeneous field	59
1.10.3. Traps with strength-less structure of the field	59
1.10.4. The effect of magnetic field inhomogeneities	59
1.10.5. Traps with an inhomogeneous regular field	60
1.10.6. Traps with a curved magnetic field	61
1.10.7. Traps with a magnetic field varying along the force lines	62
1.10.8. Traps with a magnetic field varying with time	62
1.11. Cosmic ray interactions with electromagnetic radiation in space plasma	63
1.11.1. Effects of Compton scattering of photons by accelerated particles	63
1.11.2. The influence of the nuclear photo effect on accelerated particles	70
1.11.3. Effect of the universal microwave radiation on accelerated particles	71
1.11.4. Effect of infrared radiation on accelerated particles	72
1.12. CR interaction with matter of space plasma – as the main source of cosmic gamma radiation	73
1.12.1. The matter of the problem	73
1.12.2. Gamma rays from neutral pions generated in nuclear interactions of CR with space plasma matter	73
1.12.3. Gamma ray generation by CR electrons in space plasma (bremsstrahlung and inverse Compton)	76
1.13. Gamma ray generation in space plasma by interactions of flare energetic particles with solar and stellar winds	77
1.13.1. The matter of problem and the main three factors	77
1.13.2. The 1-st factor: solar FEP space-time distribution	78
1.13.3. The 2-nd factor: space-time distribution of solar wind matter	82
1.13.4. The 3-rd factor: gamma ray generation by FEP in the Heliosphere	83

CONTENTS

ix

1.13.5. Expected angle distribution and time variations of gamma ray fluxes for observations inside the Heliosphere during FEP events	85
1.13.6. Gamma rays from interaction of FEP with stellar wind matter	89
1.13.6. Expected gamma ray fluxes from great FEP events	89
1.13.7. On the possibility of monitoring of gamma rays generated by FEP interactions with solar wind matter; the perspectives of the model developing	90
1.14. Gamma-ray generation in space plasma by interactions of galactic CR with solar and stellar winds	91
1.14.1. The matter of problem and the main three factors	91
1.14.2. The 1-st factor: galactic CR space-time distribution in the Heliosphere	92
1.14.3. The 2-nd factor: space-time distribution of solar wind matter	96
1.14.4. The 3-rd factor: gamma ray generation by galactic CR in the Heliosphere	96
1.14.5. Expected angle distribution of gamma ray fluxes from solar wind	98
1.14.6. Gamma ray fluxes from stellar winds	100
1.14.7. Summary of main results and discussion	100
1.15. On the interaction of EHE gamma-rays with the magnetic fields of the Sun and planets	103
1.15.1. The matter of the problem	103
1.15.2. Magnetic e^+ pair cascades in the magnetosphere of the Sun	104
1.15.3. The possibility that extra high energy CR spectrum at $> 10^{19}$ eV contains significant proportion of photons	105
1.15.3. Summaring of main results and discussion	107
Chapter 2. Cosmic Ray Propagation in Space Plasmas	109
2.1. The problem of CR propagation and a short review of a development of the basically concepts	109
2.2. The method of the characteristic functional and a deduction of kinetic equation for CR propagation in space at the presence of magnetic field fluctuations	111
2.3. Kinetic equation in the case of weak regular and isotropic random fields	115
2.4. Kinetic equation for CR propagation including fluctuations of plasma velocity	116
2.5. Kinetic equation for propagation of CR including electric fields in plasma	124
2.6. Kinetic equation for propagation of CR at presence of strong regular field in low-turbulence magnetized plasma in which the Alfvén waves are excited	126
2.6.1. Formulation of the problem and deduction of the basic equation	
2.6.2. The case of large wave lengths	130
2.6.3. The case of small wave lengths	130
2.7. Green's function of the kinetic equation and the features of propagation of low-energy particles	131
2.8. Kinetics of CR in a large scale magnetic field	139
2.8.1. The kinetic equation deriving on the basis of the functional method	139
2.8.2. Diffusion approximation	145
2.8.3. Diffusion of CR in a large-scale random field	147
2.8.4. CR transport in the random gyrotropic magnetic field	150
2.9. CR diffusion in the momentum space	154
2.10. CR diffusion in the pitch-angle space	158
2.11. Fokker-Planck CR transport equation for diffusion approximation	165
2.11.1. Diffusion approximation including the first spherical mode	165
2.11.2. Including of magnetic inhomogeneities velocity fluctuations	167
2.11.3. Diffusion approximation including the second spherical harmonic	168
2.11.4. Drift effects in a diffusion propagation of CR	174
2.11.5. General poloidal magnetic field effects in a diffusion propagation of CR	177
2.11.6. Derivation of the Fokker-Planck CR transport equation from variational principle	179

x	Lev Dorman <i>Cosmic Ray Interactions, Propagation, and Acceleration in Space Plasmas</i>	
2.12.	Phenomenological description of CR anisotropic diffusion	182
2.12.1.	<i>Deduction of general equation</i>	182
2.12.2.	<i>The case of propagation in a galactic arm</i>	183
2.12.3.	<i>The case of CR propagation in interplanetary space</i>	184
2.12.4.	<i>On rotation of CR gas in the interplanetary space</i>	188
2.12.5.	<i>Temporal variations and spatial anisotropy of CR in the interplanetary space</i>	189
2.12.6.	<i>The region where CR anisotropic diffusion approximation is applicable</i>	190
2.13.	On a relation between different forms of the equation of anisotropic diffusion of CR	190
2.14.	Spectral representations of Green's function of non-stationary equation of CR diffusion	194
2.14.1.	<i>Formulation of the problem</i>	194
2.14.2.	<i>Determining of the radial Green's function for a non-stationary diffusion including convection</i>	194
2.14.3.	<i>Green's function of the three-dimensional transfer equation including convection</i>	199
2.14.4.	<i>Possible including of the variations of particle energy</i>	202
2.14.5.	<i>Green's function for the stationary isotropic diffusion in the case of power dependence of the diffusion coefficient on a distance</i>	202
2.15.	On a relation between correlation function of particle velocities and pitch-angle and spatial coefficients of diffusion	203
2.15.1.	<i>Correlation function of particle velocities</i>	203
2.15.2.	<i>Connection between the correlation function of particle velocities, pitch-angle and spatial coefficients of diffusion</i>	204
2.16.	On a balance of CR energy in multiple scattering in expanding magnetic fields	206
2.17.	The second order pitch-angle approximation for the CR Fokker-Planck kinetic equation	210
2.17.1.	<i>The matter of the problem</i>	210
2.17.2.	<i>The first order approximation</i>	211
2.17.3.	<i>The second order approximation</i>	211
2.17.4.	<i>Peculiarities of the second pitch-angle approximation</i>	213
2.18.	Anomalous diffusion: modes of CR diffusion propagation	214
2.18.1.	<i>Three modes of particle propagation: classical diffusion, super-diffusion and sub-diffusion</i>	214
2.18.2.	<i>Simulation of particle propagation in a two-dimensional static magnetic field turbulence</i>	214
2.19.	Energetic particle mean free path in the Alfvén wave heated space plasma	217
2.19.1.	<i>Space plasma heated by Alfvén waves and how it influenced on particle propagation and acceleration</i>	217
2.19.2.	<i>Determining of the Alfvén wave power spectrum</i>	218
2.19.3.	<i>Determining of the energetic particle mean free path</i>	219
2.20.	Bulk speeds of CR resonant with parallel plasma waves	221
2.20.1.	<i>Formation of the bulk speeds that are dependent on CR charge/mass and momentum</i>	221
2.20.2.	<i>Dispersion relation and resonance condition</i>	222
2.20.3.	<i>Effective wave speed</i>	223
2.20.4.	<i>Bulk motion of the CR in space plasma</i>	225
2.21.	Non-resonant pitch-angle scattering and parallel mean-free-path	227
2.21.1.	<i>The problem of the non-resonant pitch-angle scattering</i>	227
2.21.2.	<i>Derivation of the non-resonant scattering process</i>	229
2.21.3.	<i>Resulting mean free path and comparison with gyro-resonant model</i>	232
2.21.4.	<i>Contribution from slab and oblique Alfvén waves to the non-resonant pitch-angle scattering</i>	233
2.21.5.	<i>Parallel mean free path: comparison of the theoretical predictions with the measurements</i>	234

CONTENTS

2.22. On the cosmic ray cross-field diffusion in the presence of highly perturbed magnetic fields	235
2.22.1. <i>The matter of problem</i>	235
2.22.2. <i>Description of Monte Carlo particle simulations</i>	236
2.22.3. <i>Wave field models</i>	237
2.22.4. <i>Simulations for Alfvénic turbulence models A, B1, B2</i>	238
2.22.5. <i>Simulations for oblique MHD waves models C-AF, C-AK, C-MF, and C-MK</i>	240
2.23. Dispersion relations for CR particle diffusive propagation	242
2.23.1. <i>The matter of the problem and denominations</i>	242
2.23.2. <i>Dispersion relations for diffusion and telegrapher's equations</i>	243
2.23.3. <i>Dispersion relations in general case</i>	244
2.23.4. <i>Dispersion relations for isotropic pitch-angle scattering</i>	245
2.23.5. <i>Dispersion relations for the cases with dominant helicity</i>	246
2.23.6. <i>Dispersion relations for focusing scattering</i>	246
2.23.7. <i>Dispersion relations for hemispherical scattering</i>	247
2.24. The dynamics of dissipation range fluctuations with application to CR propagation theory	248
2.24.1. <i>The matter of problem</i>	248
2.24.2. <i>Magnetic helicity according to WIND spacecraft measurements</i>	250
2.24.3. <i>Anisotropy according to WIND spacecraft measurements</i>	250
2.24.4. <i>Slab waves and 2D turbulence according to WIND spacecraft measurements</i>	251
2.25. A path integral solution to the stochastic differential equation of the Markov process for CR transport	252
2.25.1. <i>The matter of the problem</i>	252
2.25.2. <i>Diffusion and Markov stochastic processes; used definitions</i>	253
2.25.3. <i>Path integral representation for the transition probability of Markov processes</i>	255
2.25.4. <i>Main results and method's checking</i>	257
2.26. Velocity correlation functions and CR transport (compound diffusion)	258
2.26.1. <i>The matter of problem</i>	258
2.26.2. <i>Compound CR diffusion</i>	259
2.26.3. <i>The Kubo formulation applied to compound diffusion</i>	260
2.26.4. <i>Main results</i>	263
2.27. The BGK Boltzmann equation and anisotropic diffusion	263
2.27.1. <i>The matter of problem</i>	263
2.27.2. <i>Description of the model</i>	264
2.27.3. <i>The diffusion approximation</i>	265
2.27.4. <i>Evaluation of the Green function</i>	266
2.27.5. <i>Long-scale, large-time asymptotics</i>	269
2.27.6. <i>Pitch angle evolution and perpendicular diffusion</i>	271
2.27.7. <i>Summary of main results</i>	272
2.28. Influence of magnetic clouds on the CR propagation	273
2.28.1. <i>The matter of the problem</i>	273
2.28.2. <i>The numerical model</i>	273
2.28.3. <i>Numerical results</i>	275
2.28.4. <i>Comparison with observations</i>	277
2.29. Non-diffusive CR particle pulse transport	280
2.29.1. <i>The matter of problem</i>	280
2.29.2. <i>Kinetic equation</i>	281
2.29.3. <i>Pitch angle response function for neutron monitors</i>	282
2.29.4. <i>Time-finite injection</i>	282
2.29.5. <i>Three parts of resulting solution</i>	282
2.29.6. <i>Expected temporal profiles for neutron monitors and comparison with observations</i>	284

xii **Lev Dorman** *Cosmic Ray Interactions, Propagation, and Acceleration in Space Plasmas*

2.30. Pitch angle diffusion of energetic particles by large amplitude MHD waves	288
2.30.1. <i>The matter of the problem</i>	288
2.30.2. <i>The used model</i>	289
2.30.3. <i>Main results of simulation</i>	289
2.31. Particle diffusion across the magnetic field and the anomalous transport of magnetic field lines	293
2.31.1. <i>On the anomalous transport of magnetic field lines in quasi-linear regime</i>	293
2.31.2. <i>Quasi-linear theory for magnetic lines diffusion</i>	294
2.31.3. <i>Quasi-linear spreading of magnetic field lines</i>	295
2.31.4. <i>The transport exponent and transport coefficient for magnetic field lines</i>	297
2.31.5. <i>Comparison with the original quasi-linear prediction</i>	299
2.31.6. <i>Summary of main results and discussion</i>	301
2.32. CR transport in the fractal-like medium	301
2.32.1. <i>The matter of problem and main relations</i>	301
2.32.2. <i>Formation of CR spectrum in the frame of anomaly diffusion in the fractal-like medium</i>	303
2.32.3. <i>Parameters of the model and numerical calculations</i>	304
2.32.4. <i>Application to the problem of galactic CR spectrum formation</i>	305
2.33. CR propagation in large-scale anisotropic random and regular magnetic fields	306
2.33.1. <i>The matter of problem</i>	306
2.33.2. <i>Main equations and transforming of collision integral</i>	307
2.33.4. <i>Kinetic coefficients and transport mean free paths</i>	309
2.33.5. <i>Comparison with experimental data</i>	311
2.34. CR perpendicular diffusion calculations on the basis of MHD transport models	312
2.34.1. <i>The matter of problem</i>	312
2.34.2. <i>Three models for perpendicular diffusion coefficient</i>	312
2.34.3. <i>The main results for diffusion coefficients</i>	315
2.34.4. <i>Summarizing and comparison of used three models</i>	318
2.35. On the role of drifts and perpendicular diffusion in CR propagation	319
2.35.1. <i>Main equations for CR gradient and curvature drifts in the interplanetary magnetic field</i>	319
2.35.2. <i>The using of Archimedean-spiral model of interplanetary magnetic field</i>	321
2.35.3. <i>The illustration results on the nature of CR drift modulation</i>	322
2.36. Drifts, perpendicular diffusion, and rigidity dependence of near-Earth latitudinal proton density gradients	324
2.36.1. <i>The matter of the problem</i>	324
2.36.2. <i>The propagation and modulation model, and diffusion tensor</i>	324
2.36.3. <i>Latitudinal gradients for CR protons</i>	327
2.36.4. <i>Discussion on the nature of CR latitudinal transport</i>	328
2.37. CR drifts in dependence of Heliospheric current sheet tilt angle	329
2.37.1. <i>The matter of the problem</i>	329
2.37.2. <i>CR propagation and modulation model; solar minimum spectra</i>	329
2.37.3. <i>Tilt angle dependence of CR protons at Earth</i>	330
2.37.4. <i>Tilt angle dependence of CR intensity ratios at Earth orbit</i>	332
2.37.5. <i>Discussion of main results</i>	333
2.38. CR drifts in a fluctuating magnetic fields	334
2.38.1. <i>The matter of problem</i>	334
2.38.2. <i>Analytical result and numerical simulations for CR particle drifts</i>	336
2.38.3. <i>Numerical simulations by integration of particle trajectories</i>	337
2.38.4. <i>Summary of main results</i>	339

xiv **Lev Dorman** *Cosmic Ray Interactions, Propagation, and
Acceleration in Space Plasmas*

Chapter 3. Cosmic Ray Nonlinear Effects in Space Plasmas	405
3.1. The important role of CR nonlinear effects in many processes and objects in space	405
3.2. Effects of CR pressure	406
3.3. Effects of CR kinetic stream instability	407
3.4. On the structure and evolution of CR-space plasma nonlinear systems	409
3.4.1. Principles of hydrodynamic approach to the CR-space plasma nonlinear systems	409
3.4.2. Four-fluid model for description CR-plasma system	410
3.4.3. Steady state profiles of the CR-plasma system	411
3.5. Nonlinear Alfvén waves generated by CR streaming instability	415
3.5.1. Possible damping mechanisms for Alfvén turbulence generated by CR streaming instability	415
3.5.2. Basic equations described the nonlinear Alfvén wave damping rate in presence of thermal collisions	416
3.5.3. On the possible role of nonlinear damping saturation in the CR-plasma systems	420
3.6. Interplanetary CR modulation, possible structure of the Heliosphere and expected CR nonlinear effects	421
3.6.1. CR hysteresis effects and dimension of the modulation region; importance of CR nonlinear effects in the outer Heliosphere	421
3.6.2. Long - term CR spectrum modulation in the Heliosphere	423
3.6.3. CR anisotropy in the Heliosphere	425
3.6.4. Possible structure of the Heliosphere and expected nonlinear effects	426
3.6.5. Studies of the termination shock and heliosheath at > 92 AU: Voyager 1 magnetic field measurements	428
3.7. Radial CR pressure effects in the Heliosphere	433
3.7.1. On a necessity of including non-linear large-scale effects in studies of propagation of solar and galactic CR in interplanetary space	433
3.7.2. Radial braking of solar wind and CR modulation: effect of galactic CR pressure	434
3.7.3. Radial braking of solar wind and CR modulation: effects of galactic CR pressure and re-exchange processes with interstellar neutral hydrogen atoms	439
3.8. Expected change of solar wind Mach number accounting the effects of radial CR pressure and re-charging with neutral interstellar atoms	444
3.9. On the type of transition layer from supersonic to subsonic fluid of solar wind	445
3.10. Non-linear influence of pickup ions, anomalous and galactic CR on the Heliosphere's termination shock structure	447
3.10.1. Why investigations of Heliosphere's termination shock are important?	447
3.10.2. Description of the self-consistent model and main equations	448
3.10.3. Using methods of numerical calculations	450
3.10.4. Expected differential CR intensities on various heliocentric distances	450
3.10.5. Different cases of Heliospheric shock structure and solar wind expansion	452
3.10.6. The summary of obtained results	456
3.11. Expected CR pressure effects in transverse directions in Heliosphere	458
3.11.1. CR transverse gradients in the Heliosphere and its possible influence on solar wind moving	458
3.11.2. The simple model for estimation of upper limit of CR transverse effects on solar wind	458
3.11.3. The effect of the galactic CR gradients on propagation of solar wind in meridional plane	463
3.12. Effects of CR kinetic stream instability in the Heliosphere	466
3.12.1. Rough estimation of stream instability effect at constant solar wind speed	466
3.12.2. Self - consistent problem including effects of CR pressure and kinetic stream instability in the Heliosphere	470
3.12.3. Main results for Heliosphere	475

3.16.1. On the balance of Alfvén wave generation by CR streaming instability with damping mechanisms	489
3.16.2. Basic equations and their solutions	490
3.16.3. Summary of main results	494
Chapter 4. Cosmic Ray Acceleration in Space Plasmas	495
4.1. Acceleration particles in space plasmas as universal phenomenon in the Universe	495
4.2. The Fermi mechanism of statistical acceleration	497
4.3. Development of Fermi model: head-on and overtaking collisions	499
4.3.1. Non-relativistic case	499
4.3.2. Relativistic case	500
4.4. Development of Fermi model: inclusion of oblique collisions	502
4.4.1. Non-relativistic case	502
4.4.2. Relativistic case	507
4.5. Statistical acceleration of particles during the variations in the acceleration mechanism parameters as particles gain energy	510
4.5.1. The expected variations of the acceleration mechanism parameters as a particles gain energy	510
4.5.2. The mode of particle energy change and formation of the spectrum in the non-relativistic range for the statistical acceleration mechanism including the dependence of λ and u on energy	511
4.5.3. Particle acceleration and formation of the spectrum in relativistic energy range including the variations in the parameters λ and u with total particle energy E increasing	514
4.5.4. The nature of the constraint of the accelerated particle energy	516
4.6. Formation of particle rigidity spectrum during statistical acceleration	518
4.6.1. General remarks and basic relations	518
4.6.2. Non-relativistic range; λ and u are independent of R	519
4.6.3. Non-relativistic case; λ and u are functions of R	521
4.6.4. Relativistic range; λ and u are independent of R	529
4.6.5. Relativistic range; λ and u are functions of R	532
4.7. Statistical acceleration by scattering on small angles	535
4.7.1. Small-angle scattering	535
4.7.2. Energy gain in head-on collisions in non-relativistic case for small angle scatterings	538
4.7.3. Energy change in non-relativistic case for oblique collision	540
4.7.4. Energy change in relativistic case	543
4.7.5. The mode of particle energy change in time	543
