

ARITHMETICAL BIRATIONAL INVARIANTS OF LINEAR ALGEBRAIC GROUPS OVER TWO-DIMENSIONAL GEOMETRIC FIELDS

MIKHAIL BOROVOI AND BORIS KUNYAVSKIĬ
WITH AN APPENDIX BY PHILIPPE GILLE

To Valentin Evgenyevich Voskresenskiĭ on the occasion of his 75th birthday

ABSTRACT. Let G be a connected linear algebraic group over a geometric field k of cohomological dimension 2 of one of the types which were considered by Colliot-Thélène, Gille and Parimala. Basing on their results, we compute the group of classes of R -equivalence $G(k)/R$, the defect of weak approximation $A_\Sigma(G)$, the first Galois cohomology $H^1(k, G)$, and the Tate–Shafarevich kernel $\text{III}^1(k, G)$ (for suitable k) in terms of the algebraic fundamental group $\pi_1(G)$. We prove that the groups $G(k)/R$ and $A_\Sigma(G)$ and the set $\text{III}^1(k, G)$ are stably k -birational invariants of G .

Keywords: two-dimensional geometric field, linear algebraic group, birational invariants, R -equivalence, weak approximation, Tate–Shafarevich kernel.

0. INTRODUCTION

0.1. Let k be a field of one of the three types below, where k_0 is an algebraically closed field of characteristic 0:

(gl) a function field k in two variables over k_0 , i.e. the function field of a smooth, projective, connected surface over k_0 ;

(ll) the field of fractions k of a two-dimensional, excellent, henselian local domain A with residue field k_0 ;

(sl) the Laurent series field $k = l((t))$ over a field l of characteristic 0 and cohomological dimension 1.

Let G be a connected linear k -group. In the case (gl) we always assume that G has no factors of type E_8 .

0.2. In [11], [12] the arithmetic of linear algebraic groups over such fields was investigated. In particular, when G is semisimple simply connected, it was proved that $H^1(k, G) = 1$ and $G(k)/R = 1$ (where $G(k)/R$ denotes the group of classes of R -equivalence); in the cases (gl) or (ll) it was proved that the defect of weak approximation $A_\Sigma(G)$ equals 1 with respect to any finite set Σ of associated discrete valuations, i.e. G has weak approximation property with respect to Σ . It was proved that in the second non-abelian cohomology set $H^2(k, L)$ all the elements are neutral, if the k -kernel (k -band) $L = (\bar{G}, \kappa)$ is such that \bar{G} is semisimple simply connected.

Assume that G is a reductive k -group admitting a special covering, i.e. there exists an exact sequence

$$1 \rightarrow \mu \rightarrow G_0 \times N \rightarrow G \rightarrow 1,$$

where G_0 is a semisimple simply connected group, N is a quasi-trivial torus and μ is a finite abelian k -group. For such groups G the group of classes of R -equivalence $G(k)/R$ and the defect of weak approximation $A_\Sigma(G)$ were computed by Colliot-Thélène, Gille, and Parimala [12] in terms of μ .

The second named author was partially supported by the Ministry of Absorption (Israel), the Minerva Foundation through the Emmy Noether Research Institute of Mathematics, and INTAS 00-566.

0.3. In the present paper we do not assume that G admits a special covering. Basing on the fundamental results of [12], for a connected linear k -group G we compute the group $G(k)/R$, the group $A_\Sigma(G)$ (in the cases (gl) and (ll)), the Galois cohomology set $H^1(k, G)$, and the Tate–Shafarevich set $\text{III}^1(k, G)$ (in the case (ll)) in terms of the algebraic fundamental group $\pi_1(G)$. We prove that the groups $G(k)/R$ and $A_\Sigma(G)$ and the set $\text{III}^1(k, G)$ are stably k -birational invariants of G . We also consider the case where k is a number field.

0.4. We describe our results in more detail. First let k be any field of characteristic 0. Let $\Gamma = \text{Gal}(\bar{k}/k)$, where \bar{k} is a fixed algebraic closure of k . For a reductive k -group G let $\pi_1(G)$ denote the algebraic fundamental group of G introduced in [6]. For any connected linear k -group G let G^u denote its unipotent radical and let $G^{\text{red}} = G/G^u$; it is a reductive group. We set $\pi_1(G) := \pi_1(G^{\text{red}})$; it is a finitely generated (over \mathbf{Z}) Γ -module. (For another definition of $\pi_1(G)$ see [33, Sect. 10].)

We consider an additive functor \mathcal{H} from the category of k -tori to the category of abelian groups, with the following property: $\mathcal{H}(N) = 0$ for any quasi-trivial torus N . An example of such a functor is $T \mapsto H^1(k, T)$.

In Section 1 we consider a coflasque resolution of $\pi_1(G)$

$$0 \rightarrow Q \rightarrow P \rightarrow \pi_1(G) \rightarrow 0$$

(i.e. P is a permutation Γ -module and Q is a coflasque Γ -module). Let F_G denote the flasque torus such that $\mathbf{X}_*(F_G) = Q$, where \mathbf{X}_* denotes the cocharacter group. We show that $\mathcal{H}(F_G)$ is determined uniquely by G up to canonical isomorphism, and we obtain a functor $G \mapsto \mathcal{H}(F_G)$.

In Section 2 we consider a smooth rational k -variety X . Let V_X denote a smooth compactification of X . Write $\bar{V}_X = V_X \times_k \bar{k}$. Let S_X be the Néron–Severi torus of V_X , i.e. the k -torus such that $\mathbf{X}^*(S_X) = \text{Pic } \bar{V}_X$, where \mathbf{X}^* denotes the character group. We show that $\mathcal{H}(S_X)$ is determined uniquely by X up to canonical isomorphism, and we obtain a functor $X \mapsto \mathcal{H}(S_X)$. The group $\mathcal{H}(S_X)$ is a stably k -birational invariant of X .

In Section 3 we prove that for a connected k -group G , $\text{Pic } \bar{V}_G$ is a flasque Γ -module (thus we generalize a theorem of Voskresenskiĭ on tori). Using this result we prove that $\mathcal{H}(F_G) \simeq \mathcal{H}(S_G)$ and that $F_G \times N_1 \simeq S_G \times N_2$ for some quasi-trivial k -tori N_1 and N_2 .

In Section 4 we assume that k is as in 0.1. We prove that $G(k)/R \simeq H^1(k, F_G)$. We take $\mathcal{H}(T) = H^1(k, T)$. Using the results of Sections 3 and 2, we obtain that $G(k)/R \simeq H^1(k, S_G)$ and therefore the group $G(k)/R$ is a stably k -birational invariant of G .

In Section 5 we consider weak approximation for G with respect to a finite set Σ of associated discrete valuations of k . We assume that k is of type (gl) or (ll). For a k -torus T set

$$\mathfrak{U}_\Sigma^1(k, T) = \text{coker} \left[H^1(k, T) \rightarrow \prod_{v \in \Sigma} H^1(k_v, T) \right]$$

(\mathfrak{U} is pronounced “chuh”). We prove that $A_\Sigma(G) \simeq \mathfrak{U}_\Sigma^1(k, F_G)$. We take $\mathcal{H}(T) = \mathfrak{U}_\Sigma^1(k, T)$. Using the results of Sections 3 and 2, we obtain that $A_\Sigma(G) \simeq \mathfrak{U}_\Sigma^1(k, S_G)$ and therefore $A_\Sigma(G)$ is a stably k -birational invariant of G .

In Section 6 we consider $H^1(k, G)$. In [6] for any field k of characteristic 0 the group of abelian Galois cohomology $H_{\text{ab}}^1(k, G)$ was defined in terms of $\pi_1(G)$. A canonical abelianization map $\text{ab}^1: H^1(k, G) \rightarrow H_{\text{ab}}^1(k, G)$ was defined. We prove here that if k is as in 0.1, then ab^1 is a bijection. Thus $H^1(k, G)$ has a canonical, functorial structure of an abelian group.

In Section 7 we consider the Hasse principle for G when k is of type (ll). Using the result of Section 6, we prove that there is a canonical bijection $\text{III}^1(k, G) \simeq \text{III}^2(k, F_G)$. We take $\mathcal{H}(T) = \text{III}^2(k, T)$. Using the results of Sections 3 and 2, we obtain that $\text{III}^1(k, G) \simeq \text{III}^2(k, S_G)$ and that the cardinality of the set $\text{III}^1(k, G)$ is a stably k -birational invariant of G . In particular, if G is stably k -rational, then $\text{III}^1(k, G) = 1$.

The results of Sections 4–7 hold also when k is a totally imaginary number field. In Section 8 we establish analogues of these results when k is any number field, not necessarily totally imaginary.

The proof of our formula for $G(k)/R$ in Section 4 is based on the difficult Lemma 4.12. This lemma is proved in the Appendix by P. Gille. Gille also proves a similar (and more difficult) result over a number field which we use in Section 8.

For a discussion of our results (with references) see the text of the paper below. Here we only note that we use the method of Kottwitz [27] in order to reduce the assertions to the known case of tori.

Acknowledgements. We are very grateful to Philippe Gille for writing the Appendix to this paper, where he proves the crucial Lemma 4.12, and for helpful discussions and correspondence. We are very grateful to Jean-Louis Colliot-Thélène for his help in finding another proof of Lemma 4.12 and for asking stimulating questions. We are grateful to Joseph Bernstein, Shmuel Rosset, and Joost van Hamel for useful discussions. The first-named author worked on the paper during his stay at the University of Sciences and Technologies of Lille, the hospitality and support of which are gratefully acknowledged.

Notation and conventions.

k is a field of characteristic 0, \bar{k} is a fixed algebraic closure of k , $\Gamma = \text{Gal}(\bar{k}/k)$. By a Γ -module we mean a finitely generated over \mathbf{Z} discrete Γ -module.

Let G be a connected linear algebraic group defined over k . We define G^u and G^{red} as in 0.4. Let G^{ss} denote the derived group of G^{red} ; it is semisimple. Set $G^{\text{tor}} = G^{\text{red}}/G^{\text{ss}}$; it is a torus. Let G^{sc} denote the universal covering of G^{ss} ; it is simply connected.

In Sections 1–3 \mathcal{H} is a covariant functor from the category of k -tori to the category of abelian groups satisfying the following conditions:

- (1) let $f_1, f_2: T' \rightarrow T''$ be two homomorphisms of k -tori, then $\mathcal{H}(f_1 + f_2) = \mathcal{H}(f_1) + \mathcal{H}(f_2)$;
- (2) $\mathcal{H}(T_1 \times T_2) \simeq \mathcal{H}(T_1) \oplus \mathcal{H}(T_2)$ for any two k -tori T_1 and T_2 ;
- (3) $\mathcal{H}(N) = 0$ for any quasi-trivial k -torus N .

A functor satisfying (1) is called additive, and (2) follows from (1), cf. [30, Ch. VIII.2, Prop. 4 on p. 193]. From (2) and (3) follows the following property:

- (4) if $p_T: T \times N \rightarrow T$ is the projection, where N is a quasi-trivial torus, then $p_{T*}: \mathcal{H}(T \times N) \rightarrow \mathcal{H}(T)$ is an isomorphism.

An example of such a functor is $\mathcal{H}(T) = H^1(k, T)$. Another example is $\mathcal{H}(T) = \text{III}^2(k, T)$ when k is a number field.

1. FUNCTOR $\mathcal{H}(F_G)$

Let k be a field of characteristic 0. In this section we construct a functor $G \mapsto \mathcal{H}(F_G)$ from the category of connected linear algebraic k -groups to abelian groups. Here F_G is the flasque torus coming from a coflasque resolution of $\pi_1(G)$.

1.1. A Γ -module P is called a permutation module if it is torsion-free and has a Γ -invariant basis. A Γ -module is called coflasque if it is torsion-free and $H^1(\Gamma', Q) = 0$ for every open subgroup $\Gamma' \subset \Gamma$. Any permutation module is coflasque.

A coflasque resolution of a Γ -module A is an exact sequence of Γ -modules

$$(R) \quad 0 \rightarrow Q \rightarrow P \xrightarrow{\alpha} A \rightarrow 0,$$

where P is a permutation module and Q is a coflasque module.

Lemma 1.2. ([16, Lemme 0.6]) *Every Γ -module A admits a coflasque resolution. Moreover if $\bar{\Gamma}$ is the image of Γ in $\text{Aut } A$, then there exists a coflasque resolution (R) of A such that Γ acts on P and Q through $\bar{\Gamma}$.*

1.3. A k -torus F is called flasque if its cocharacter group $\mathbf{X}_*(F)$ is a coflasque Γ -module. A k -torus N is called quasi-trivial if it is isomorphic to the product $\prod_i R_{K_i/k} \mathbf{G}_{m, K_i}$, where K_i/k

are finite extensions. In other words, N is quasi-trivial if and only if $\mathbf{X}_*(N)$ is a permutation Γ -module.

Let (R) be a coflasque resolution of a Γ -module A . Let $F_{(R)}$ denote the flasque torus such that $\mathbf{X}_*(F_{(R)}) = Q$. Set $\mathcal{F}(R) = \mathcal{H}(F_{(R)})$, where \mathcal{H} is a functor as in Notation and conventions. We shall prove that $\mathcal{F}(R)$ depends only on A and is functorial in A .

Note that for two coflasque resolutions

$$(R'_i) \quad 0 \rightarrow Q_i \rightarrow P_i \rightarrow A \rightarrow 0 \quad (i = 1, 2)$$

of a Γ -module A , we have $Q_1 \oplus P'_1 \simeq Q_2 \oplus P'_2$ for some permutation modules P'_1 and P'_2 cf. [16, Lemme 0.6]. Thus $\mathcal{H}(F_{(R'_1)}) \simeq \mathcal{H}(F_{(R'_2)})$ by property (4) of \mathcal{H} , see Notation and conventions. We prove below that there exists a *canonical* isomorphism, permitting to identify $\mathcal{H}(F_{(R'_1)})$ and $\mathcal{H}(F_{(R'_2)})$.

1.4. Let

$$(R_i) \quad 0 \rightarrow Q_i \rightarrow P_i \xrightarrow{\alpha_i} A_i \rightarrow 0 \quad (i = 1, 2)$$

be coflasque resolutions. We always regard Q_i as a subgroup of P_i . A *morphism* $(R_1) \rightarrow (R_2)$ is a pair of homomorphisms of Γ -modules $f: A_1 \rightarrow A_2$, $\psi: P_1 \rightarrow P_2$ such that the following diagram is commutative:

$$\begin{array}{ccc} P_1 & \xrightarrow{\alpha_1} & A_1 \\ \psi \downarrow & & \downarrow f \\ P_2 & \xrightarrow{\alpha_2} & A_2 \end{array}$$

Then ψ defines a homomorphism $Q_1 \rightarrow Q_2$ (as the restriction of ψ to Q_1). Thus a pair (f, ψ) gives rise to a homomorphism $\mathcal{F}(f, \psi): \mathcal{F}(R_1) \rightarrow \mathcal{F}(R_2)$.

Lemma 1.5. *Let*

$$(R') \quad 0 \rightarrow Q' \rightarrow P' \xrightarrow{\alpha'} A' \rightarrow 0$$

$$(R'') \quad 0 \rightarrow Q'' \rightarrow P'' \xrightarrow{\alpha''} A'' \rightarrow 0$$

be coflasque resolutions. Let $f: A' \rightarrow A''$ be a homomorphism of Γ -modules. Then f extends to a morphism $(f, \psi): (R') \rightarrow (R'')$.

Proof. Set $P = P' \times_{A''} P'' = \{(x', x'') \in P' \times P'' \mid f(\alpha'(x')) = \alpha''(x'')\}$. Let $p': P \rightarrow P'$ denote the projection defined by $p'(x', x'') = x'$. Clearly $\ker p' \simeq Q''$. We obtain an exact sequence

$$0 \rightarrow Q'' \rightarrow P \xrightarrow{p'} P' \rightarrow 0.$$

Since P' is a permutation module and Q'' is a coflasque module, we have $\text{Ext}^1(P', Q'') = 0$ (cf. [29, Prop. 1.2]). Thus there exists a splitting $\beta: P \rightarrow P'$ such that $p' \circ \beta = \text{id}_{P'}$. Write $\beta(x') = (x', \psi(x'))$, where $\psi(x') \in P''$, $\alpha''(\psi(x')) = f(\alpha'(x'))$. Clearly (f, ψ) is a morphism $(R') \rightarrow (R'')$ extending f . \square

Lemma 1.6. *Let $(R'), (R'')$ be as in Lemma 1.5. Let $(f, \psi): (R') \rightarrow (R'')$ be any morphism of coflasque resolutions. Then the homomorphism $\mathcal{F}(f, \psi): \mathcal{F}(R_1) \rightarrow \mathcal{F}(R_2)$ does not depend on ψ .*

Proof. Let $\psi_1, \psi_2: P' \rightarrow P''$ be two homomorphisms of Γ -modules compatible with $f: A' \rightarrow A''$. Let $\chi = \psi_1 - \psi_2: P' \rightarrow P''$. Then clearly $\text{im } \chi \in \ker \alpha'' = Q''$. We may and shall regard χ as a homomorphism $\chi: P' \rightarrow Q''$.

Let $\theta_i: Q' \rightarrow Q''$ be the homomorphisms induced by ψ_i ($i = 1, 2$), where we regard Q', Q'' as submodules of P', P'' , respectively. Then $\theta_i(x') = \psi_i(x')$ for any $x' \in Q'$. We see that $\theta_2 - \theta_1 = \chi|_{Q'}$. But $\chi|_{Q'}: Q' \rightarrow Q''$ factors through P' . It follows that

$$\mathcal{F}(f, \psi_2) - \mathcal{F}(f, \psi_1): \mathcal{H}(F_{(R')}) \rightarrow \mathcal{H}(F_{(R'')})$$

factors through $\mathcal{H}(N')$, where N' is the k -torus such that $\mathbf{X}_*(N') = P'$. Since N' is a quasi-trivial torus, we have $\mathcal{H}(N') = 0$ and $\mathcal{F}(f, \psi_2) - \mathcal{F}(f, \psi_1) = 0$. Thus $\mathcal{F}(f, \psi_1) = \mathcal{F}(f, \psi_2)$. \square

We shall write $\mathcal{F}(f)_{(\mathbb{R}', \mathbb{R}'')}$ instead of $\mathcal{F}(f, \psi)$.

1.7. Now using Lemmas 1.2, 1.5 and 1.6, we shall prove by a categoric argument that the correspondence $A \mapsto \mathcal{F}(A)$ defines a functor $A \mapsto \mathcal{F}(A)$ from the category of Γ -modules to the category of abelian groups.

(i) Assume we have three coflasque resolutions (\mathbb{R}') , (\mathbb{R}'') , (\mathbb{R}''') as above. Let $f: A' \rightarrow A''$ and $g: A'' \rightarrow A'''$ be homomorphisms of Γ -modules. Then it is easy to see that

$$\mathcal{F}(g \circ f)_{(\mathbb{R}', \mathbb{R}''')} = \mathcal{F}(g)_{(\mathbb{R}'', \mathbb{R}''')} \circ \mathcal{F}(f)_{(\mathbb{R}', \mathbb{R}'')}.$$

(ii) Consider the case when we have one Γ -module A and one coflasque resolution

$$(R) \quad 0 \rightarrow Q \rightarrow P \rightarrow A \rightarrow 0.$$

Then $\mathcal{F}(\text{id}_A)_{(R, R)}: \mathcal{F}(R) \rightarrow \mathcal{F}(R)$ equals $\text{id}_{\mathcal{F}(R)}$.

(iii) Consider the case of two coflasque resolutions of the same Γ -module A :

$$(R_i) \quad 0 \rightarrow Q_i \rightarrow P_i \rightarrow A \rightarrow 0 \quad (i = 1, 2).$$

Set $\varphi_{12} = \mathcal{F}(\text{id}_A)_{(R_1, R_2)}: \mathcal{F}(R_1) \rightarrow \mathcal{F}(R_2)$. One can easily prove that φ_{12} is an isomorphism. We have constructed a canonical isomorphism $\varphi_{12}: \mathcal{F}(R_1) \rightarrow \mathcal{F}(R_2)$.

(iv) Now consider three coflasque resolutions of one Γ -module A :

$$(R_i) \quad 0 \rightarrow Q_i \rightarrow P_i \rightarrow A \rightarrow 0 \quad (i = 1, 2, 3).$$

By (iii) we have canonical isomorphisms $\varphi_{ij}: \mathcal{F}(R_i) \rightarrow \mathcal{F}(R_j)$. By (i) we have $\varphi_{23} \circ \varphi_{12} = \varphi_{13}$.

(v) Let A be a Γ -module. For any two coflasque resolutions $(R_1), (R_2)$ of A we identify $\mathcal{F}(R_1)$ with $\mathcal{F}(R_2)$ using the canonical isomorphism φ_{12} . We thus obtain an abelian group which we denote by $\mathcal{F}(A)$. Note that the group $\mathcal{F}(A)$ is well defined because of (iv).

(vi) Let $f: A' \rightarrow A''$ be a homomorphism of Γ -modules, and let $(\mathbb{R}'_i) \rightarrow (\mathbb{R}''_i)$ ($i = 1, 2$) be two morphisms of coflasque resolutions extending f . Then it is easy to see that the following diagram is commutative:

$$\begin{array}{ccc} \mathcal{F}(\mathbb{R}'_1) & \xrightarrow{\mathcal{F}(f)_{(\mathbb{R}'_1, \mathbb{R}''_1)}} & \mathcal{F}(\mathbb{R}''_1) \\ \varphi'_{12} \downarrow & & \downarrow \varphi''_{12} \\ \mathcal{F}(\mathbb{R}'_2) & \xrightarrow{\mathcal{F}(f)_{(\mathbb{R}'_2, \mathbb{R}''_2)}} & \mathcal{F}(\mathbb{R}''_2) \end{array}$$

(vii) Let $f: A' \rightarrow A''$ be a homomorphism of Γ -modules. Choose coflasque resolutions (\mathbb{R}') and (\mathbb{R}'') of A' and A'' , respectively. We define $\mathcal{F}(f): \mathcal{F}(A') \rightarrow \mathcal{F}(A'')$ to be $\mathcal{F}(f)_{(\mathbb{R}', \mathbb{R}'')}: \mathcal{F}(\mathbb{R}') \rightarrow \mathcal{F}(\mathbb{R}'')$. By (vi) this homomorphism is well defined (does not depend on the choice of resolutions).

Thus we have defined a functor $A \mapsto \mathcal{F}(A)$ from Γ -modules to abelian groups. We shall denote $\mathcal{F}(A)$ by $\mathcal{H}(F_A)$.

1.8. We recall the definition of algebraic fundamental group $\pi_1(G)$ of a connected linear algebraic group G from [6].

First assume that G is reductive. Consider the composition

$$\rho: G^{\text{sc}} \rightarrow G^{\text{ss}} \hookrightarrow G.$$

In general the homomorphism ρ is neither surjective nor injective. Let $T \subset G$ be a maximal torus (defined over k). Set $T^{\text{sc}} = \rho^{-1}(T) \subset G^{\text{sc}}$, it is a maximal torus in G^{sc} . The homomorphism $\rho: T^{\text{sc}} \rightarrow T$ induces a homomorphism of Γ -modules $\rho_*: \mathbf{X}_*(T^{\text{sc}}) \rightarrow \mathbf{X}_*(T)$, where \mathbf{X}_* denotes the cocharacter group. Set $\pi_1(G) = \mathbf{X}_*(T)/\rho_*\mathbf{X}_*(T^{\text{sc}})$. It is shown in [6] that the Γ -module $\pi_1(G)$ is well defined, i.e. does not depend on the choice of a maximal torus $T \subset G$. To a homomorphism $f: G_1 \rightarrow G_2$ there corresponds a homomorphism of Γ -modules $f_*: \pi_1(G_1) \rightarrow \pi_1(G_2)$.

For an arbitrary connected linear algebraic k -group G (not necessarily reductive) we set $\pi_1(G) := \pi_1(G^{\text{red}})$. Then π_1 is a functor from the category of connected linear algebraic k -groups to the category of Γ -modules.

1.9. Consider the functor $\mathcal{F} \circ \pi_1: G \mapsto \mathcal{H}(F_{\pi_1(G)})$ from the category of connected linear algebraic k -groups to the category of abelian groups. We shall write $\mathcal{H}(F_G)$ for $\mathcal{H}(F_{\pi_1(G)})$.

Recall that a finite group is called metacyclic if all its Sylow subgroups are cyclic.

Proposition 1.10. *Assume that the image $\bar{\Gamma}$ of Γ in $\text{Aut } \pi_1(G)$ is a metacyclic group. Then $\mathcal{H}(F_G) = 0$.*

Proof. By definition $\mathcal{H}(F_G) = \mathcal{H}(F)$ for a flasque torus F coming from a coflasque resolution of $\pi_1(G)$. By Lemma 1.2 we may assume that F splits over a metacyclic extension. By a theorem of Endo and Miyata (cf. [15, Prop. 2, p. 184]) there exists a k -torus T such that the torus $F \times T$ is quasi-trivial. We obtain

$$\mathcal{H}(F) \oplus \mathcal{H}(T) = \mathcal{H}(F \times T) = 0,$$

hence $\mathcal{H}(F_G) = \mathcal{H}(F) = 0$. □

2. FUNCTOR $\mathcal{H}(S_X)$

2.1. Let k be a field of characteristic 0. Let X be a smooth rational k -variety (i.e. $X \times_k \bar{k}$ is birational to an affine space). Let V_X be a smooth k -compactification of X . We consider the Γ -module $\text{Pic } \bar{V}_X$, where $\bar{V}_X = V_X \times_k \bar{k}$. It is a torsion-free group of finite \mathbf{Z} -rank (cf. e.g. [44, 4.5]). Let S_X denote the Néron–Severi torus of V_X , i.e. the k -torus with character group $\mathbf{X}^*(S_X) = \text{Pic } \bar{V}_X$. We shall show in this section that $\mathcal{H}(S_X)$ does not depend on the choice of V_X , and that the correspondence $X \mapsto \mathcal{H}(S_X)$ extends to a functor from the category of smooth rational k -varieties to the category of abelian groups. (The similar assertion about the correspondence $X \mapsto H^1(k, \text{Pic } \bar{V}_X)$ is known to experts, cf. [39, 9.0], but we could not find a reference where it was written in detail.) Moreover we shall prove that $\mathcal{H}(S_X)$ is a stably k -birational invariant of X .

2.2. Let X be a smooth geometrically integral k -variety. A smooth compactification V of X is a pair $(V, \nu: X \hookrightarrow V)$, where V is a smooth complete k -variety, and ν is an embedding of X into V as a dense open subset. We often write just V instead of (V, ν) . We say that a smooth compactification (V', ν') dominates (V, ν) if there exists a k -morphism $\lambda: V' \rightarrow V$ such that $\nu = \lambda \circ \nu'$. Then such λ is unique (because $\nu'(X)$ is dense in V').

We need three propositions on smooth compactifications.

Proposition 2.3. [24] *For any smooth geometrically integral k -variety X there exists a smooth compactification (V, ν) of X .*

Proposition 2.4. *For any two smooth compactifications V_1, V_2 of a smooth geometrically integral k -variety X , there exists a smooth compactification V_3 of X dominating both V_1 and V_2 .*

Proof. The proposition is a special case of Proposition 2.6 below. □

2.5. Let $f: X' \rightarrow X''$ be a morphism of smooth k -varieties. Let (V', ν') , (V'', ν'') be smooth compactifications of X', X'' , respectively. We say that a morphism $\psi: V' \rightarrow V''$ is *compatible* with f if the following diagram commutes:

$$\begin{array}{ccc} V' & \xrightarrow{\psi} & V'' \\ \nu' \uparrow & & \uparrow \nu'' \\ X' & \xrightarrow{f} & X'' \end{array}$$

Proposition 2.6. *Let $f: X' \rightarrow X''$ be a morphism of smooth geometrically integral varieties, and let V', V'' be smooth compactifications of X', X'' , respectively. Then there exist a smooth compactification V'_1 of X' dominating V' and a morphism $\psi: V'_1 \rightarrow V''$ compatible with f .*

Proof. See [7, 1.2.2]. This proof was communicated to us by J.-L. Colliot-Thélène. □

2.7. From now on to the end of the section we assume that X is a smooth *rational* variety (i.e. \bar{k} -rational). Let V_X be a smooth compactification of X . We define S_X as in 2.1.

2.8. Let V_1, V_2 be two smooth compactifications of X , and let S_1, S_2 be the corresponding Néron–Severi tori (i.e. $\mathbf{X}^*(S_i) = \text{Pic } \bar{V}_i, i = 1, 2$). We wish to construct an isomorphism $\varphi_{12}: \mathcal{H}(S_1) \rightarrow \mathcal{H}(S_2)$. By Proposition 2.4, there exists a smooth compactification V of X dominating both V_1 and V_2 . Let S denote the corresponding Néron–Severi torus. The domination morphism $\lambda_1: V \rightarrow V_1$ induces a homomorphism $\lambda_{1*}: S \rightarrow S_1$, and there exists an isomorphism $S \simeq S_1 \times N_1$, where N_1 is a quasi-trivial k -torus and λ_{1*} corresponds to the projection of $S_1 \times N_1$ onto S_1 (cf. [44, 4.4]). We thus obtain an isomorphism $\varphi_1: \mathcal{H}(S) \rightarrow \mathcal{H}(S_1)$ by property (4) of \mathcal{H} , see Notation and conventions. Similarly, the domination morphism $\lambda_2: V \rightarrow V_2$ induces an isomorphism $\varphi_2: \mathcal{H}(S) \rightarrow \mathcal{H}(S_2)$. We obtain an isomorphism $\varphi_{12} = \varphi_2 \circ \varphi_1^{-1}: \mathcal{H}(S_1) \rightarrow \mathcal{H}(S_2)$.

2.9. If V' is another smooth compactification of X dominating both V_1 and V_2 , we obtain another isomorphism $\varphi'_{12}: \mathcal{H}(S_1) \rightarrow \mathcal{H}(S_2)$. However there exists a smooth compactification V'' of X dominating both V and V' , and using this fact one can easily show that $\varphi'_{12} = \varphi_{12}$. Thus we have constructed a canonical isomorphism $\varphi_{12}: \mathcal{H}(S_1) \rightarrow \mathcal{H}(S_2)$.

2.10. Now let V_1, V_2, V_3 be three smooth compactifications of X , let S_1, S_2, S_3 denote the corresponding Néron–Severi tori, and let $\varphi_{ij}: \mathcal{H}(S_i) \rightarrow \mathcal{H}(S_j)$ be the canonical isomorphisms. Let V_{12} (resp. V_{23}) be a smooth compactification of X dominating V_1 and V_2 (resp. V_2 and V_3). Let V be a smooth compactification of X dominating V_{12} and V_{23} . Clearly V dominates V_1, V_2 , and V_3 , and using this fact, one can easily show that $\varphi_{13} = \varphi_{23} \circ \varphi_{12}$.

2.11. Let V_1, V_2, S_1, S_2 be as in 2.8. We can now identify $\mathcal{H}(S_1)$ with $\mathcal{H}(S_2)$ using the canonical isomorphism φ_{12} , for all pairs (V_1, V_2) . We denote the obtained group by $\mathcal{H}(S_X)$. The group $\mathcal{H}(S_X)$ is well defined because of the equality $\varphi_{13} = \varphi_{23} \circ \varphi_{12}$ of 2.10.

2.12. Let $f: X' \rightarrow X''$ be a morphism of smooth rational varieties. By Proposition 2.6 there exists a morphism of smooth compactifications $\psi: V' \rightarrow V''$; here (V', ν') and (V'', ν'') are smooth compactifications of X' and X'' , respectively, and the diagram

$$\begin{array}{ccc} V' & \xrightarrow{\psi} & V'' \\ \nu' \uparrow & & \uparrow \nu'' \\ X' & \xrightarrow{f} & X'' \end{array}$$

commutes. We obtain a homomorphism $\psi_*: \mathcal{H}(S_{X'}) \rightarrow \mathcal{H}(S_{X''})$.

Let now $\psi_1: V'_1 \rightarrow V''_1$ and $\psi_2: V'_2 \rightarrow V''_2$ be two morphisms of smooth compactifications extending a k -morphism $f: X_1 \rightarrow X_2$. Then using Propositions 2.4 and 2.6, we can construct a morphism of smooth compactifications $\psi_3: V'_3 \rightarrow V''_3$ dominating both ψ_1 and ψ_2 (in the obvious sense). Using this fact one can easily show that the diagram

$$\begin{array}{ccc} \mathcal{H}(S'_1) & \xrightarrow{\psi_{1*}} & \mathcal{H}(S''_1) \\ \varphi'_{12} \downarrow & & \downarrow \varphi''_{12} \\ \mathcal{H}(S'_2) & \xrightarrow{\psi_{2*}} & \mathcal{H}(S''_2) \end{array}$$

commutes. (Here S'_i is the Néron–Severi torus of V'_i , and so on.) Thus we have constructed a canonical homomorphism $f_*: \mathcal{H}(S_{X'}) \rightarrow \mathcal{H}(S_{X''})$.

If $f: X' \rightarrow X'', g: X'' \rightarrow X'''$ are k -morphisms of smooth rational varieties, then using Proposition 2.6 one can construct a commutative diagram

$$\begin{array}{ccccc} V' & \longrightarrow & V'' & \longrightarrow & V''' \\ \uparrow & & \uparrow & & \uparrow \\ X' & \xrightarrow{f} & X'' & \xrightarrow{g} & X''' \end{array}$$

where V' , V'' , V''' are smooth compactifications of X' , X'' , X''' , respectively. It follows that $(g \circ f)_* = g_* \circ f_*$. We see that we have constructed a functor $X \mapsto \mathcal{H}(S_X)$ from the category of smooth rational k -varieties to the category of abelian groups.

2.13. Let $f: X_1 \rightarrow X_2$ be a rational map of smooth rational varieties defined over k . In other words, let $U_1 \subset X_1$ and $U_2 \subset X_2$ be open subvarieties and $f': U_1 \rightarrow U_2$ a regular map, all defined over k . We may take $V_{U_\nu} = V_{X_\nu}$ ($\nu = 1, 2$), thus we can identify $\mathcal{H}(S_{U_\nu})$ with $\mathcal{H}(S_{X_\nu})$. The regular map $f': U_1 \rightarrow U_2$ induces a homomorphism of abelian groups $f'_*: \mathcal{H}(S_{U_1}) \rightarrow \mathcal{H}(S_{U_2})$, see 2.12. Thus we obtain a homomorphism $f_*: \mathcal{H}(S_{X_1}) \rightarrow \mathcal{H}(S_{X_2})$ which does not depend on the choice of U_1 and U_2 . Clearly if $f: X_1 \rightarrow X_2$ is a birational isomorphism, then f_* is an isomorphism.

Recall that two k -varieties X_1, X_2 are called stably k -birationally equivalent, if $X_1 \times \mathbf{P}_k^{n_1}$ and $X_2 \times \mathbf{P}_k^{n_2}$ are k -birationally equivalent for some n_1, n_2 (here $\mathbf{P}_k^{n_1}$ and $\mathbf{P}_k^{n_2}$ are projective spaces).

Proposition 2.14. $\mathcal{H}(S_X)$ is a stably k -birational invariant of X .

Proof. Let X_1 and X_2 be two stably k -birationally equivalent varieties. Then $X_1 \times \mathbf{P}_k^{n_1}$ and $X_2 \times \mathbf{P}_k^{n_2}$ are k -birationally equivalent for some n_1, n_2 . Set $Y_\nu = X_\nu \times \mathbf{P}_k^{n_\nu}$ ($\nu = 1, 2$), then there is a k -birational isomorphism $f: Y_1 \rightarrow Y_2$. The birational isomorphism f induces an isomorphism $f_*: \mathcal{H}(S_{Y_1}) \rightarrow \mathcal{H}(S_{Y_2})$, see 2.13. The projections $\psi_\nu: Y_\nu \rightarrow X_\nu$ induce isomorphisms $\psi_{\nu*}: \mathcal{H}(S_{Y_\nu}) \rightarrow \mathcal{H}(S_{X_\nu})$ ($\nu = 1, 2$). We obtain an isomorphism $\psi_{2*} \circ f_* \circ \psi_{1*}^{-1}: \mathcal{H}(S_{X_1}) \rightarrow \mathcal{H}(S_{X_2})$. \square

3. ISOMORPHISM $\mathcal{H}(F_G) \simeq \mathcal{H}(S_G)$

Let k be a field of characteristic 0. In this section we construct an isomorphism of functors $G \mapsto \mathcal{H}(S_G)$ and $G \mapsto \mathcal{H}(F_G)$ on the category of connected linear algebraic k -groups. But first we need to generalize a result of Voskresenskii.

Proposition 3.1. ([43, 4.8], [44, 4.6]) *For any k -torus T the Γ -module $\text{Pic } \overline{V}_T$ is flasque.*

Here a Γ -module M is called flasque if the dual module $M^\vee := \text{Hom}(M, \mathbf{Z})$ is coflasque.

We prove the following theorem.

Theorem 3.2. *Let G be a connected linear algebraic k -group. Then $\text{Pic } \overline{V}_G$ is a flasque module.*

Proof. (i) First, we reduce the assertion to the case of a reductive group. A Levi decomposition gives an isomorphism of k -varieties $G \simeq G^{\text{red}} \times G^{\text{u}}$, where G^{u} is a k -rational variety. We may take $V_G = V_{G^{\text{red}}} \times V_{G^{\text{u}}}$, then $\text{Pic } \overline{V}_G = \text{Pic } \overline{V}_{G^{\text{red}}} \oplus P$, where P is a permutation module. Thus if $\text{Pic } \overline{V}_{G^{\text{red}}}$ is flasque, then $\text{Pic } \overline{V}_G$ is also flasque. So we may and shall assume that G is reductive.

(ii) Let us now prove the assertion of the theorem in the case where G is quasi-split, i.e. has a Borel subgroup B defined over k . Then it follows from the Bruhat decomposition that there exists an open subset in G isomorphic to $U^- \times T \times U$, where T is a maximal torus of G , U is the unipotent radical of B , and U^- is the opposite unipotent subgroup of G . Here U and U^- are k -rational varieties. It follows that $\text{Pic } \overline{V}_G \simeq \text{Pic } \overline{V}_T \oplus P$, where P is a permutation module. Since $\text{Pic } \overline{V}_T$ is flasque by Proposition 3.1, we conclude that $\text{Pic } \overline{V}_G$ is flasque.

(iii) The general case can be reduced to the quasi-split case by the device of passage to the variety of Borel subgroups. The following argument mimics [17, Thm. 2.B.1] (see also [13, Thm. 4.2] and [7, Thm. 2.4]).

Let G be any connected reductive k -group (not necessarily quasi-split). Let Y denote the variety of Borel subgroups of G (see [40, t. III, Exp. XXII, 5.8.3] for the definition). It is a geometrically integral smooth k -variety, because $Y_{\bar{k}} \simeq G_{\bar{k}}/\overline{B}$, where $\overline{B} \subset G_{\bar{k}}$ is a Borel subgroup. The variety Y has the following property: if $Y(k') \neq \emptyset$ for a field extension k'/k , then $G_{k'}$ is quasi-split, and then by (ii) the assertion of the theorem holds for such $G_{k'}$.

Let $\overline{k(Y)}$ be an algebraic closure of $k(Y)$ containing $\bar{k}(Y)$. Since Y is geometrically integral, we see that k is algebraically closed in $k(Y)$, and therefore $\text{Gal}(\overline{k(Y)}/k(Y)) \simeq \text{Gal}(\bar{k}/k)$. The

variety Y has a $k(Y)$ -point (the generic point of Y), hence $G_{k(Y)}$ is quasi-split. It follows that $\text{Pic } \overline{V}_{G_{k(Y)}}$ is a flasque module.

(iv) We can now finish the proof of the theorem. Let $V = V_G$ be a smooth compactification of G . Since G is \bar{k} -rational, it follows from [44, 4.4] that $\text{Pic}(V \times_k \bar{k})$ is a torsion-free abelian group of finite rank, and that $\text{Pic}(V \times_k \bar{k}) = \text{Pic}(V \times_k \bar{k}(Y)) = \text{Pic}(V \times_k \overline{k(Y)})$. We denote this group by $\text{Pic } \overline{V}$. Let $Q = \text{Hom}(\text{Pic } \overline{V}, \mathbf{Z})$. We wish to prove that $\text{Pic } \overline{V}$ is a flasque Γ -module, i.e. that Q is a coflasque Γ -module. We know that Q is a coflasque $\text{Gal}(\overline{k(Y)}/k(Y))$ -module because $\text{Pic } \overline{V}$ is a flasque $\text{Gal}(\overline{k(Y)}/k(Y))$ -module.

Let k'/k be a finite field extension in \bar{k} . Set $\Gamma' = \text{Gal}(\overline{k(Y)}/k'(Y))$, $\mathfrak{g}' = \text{Gal}(\overline{k(Y)}/k'(Y))$, $\mathfrak{h} = \text{Gal}(\overline{k(Y)}/\bar{k}(Y))$. Then \mathfrak{h} acts trivially on $\text{Pic } \overline{V}$ and hence on Q . We have an isomorphism $\Gamma' \simeq \mathfrak{g}'/\mathfrak{h}$.

We have an inflation-restriction exact sequence

$$0 \rightarrow H^1(\Gamma', Q^{\mathfrak{h}}) \rightarrow H^1(\mathfrak{g}', Q) \rightarrow H^1(\mathfrak{h}, Q)$$

cf. [1, Ch. IV, Prop. 5.1]. We have $Q^{\mathfrak{h}} = Q$. Since Q is a coflasque $\text{Gal}(\overline{k(Y)}/k(Y))$ -module, we have $H^1(\mathfrak{g}', Q) = 0$. Hence $H^1(\Gamma', Q) = 0$. We have proved that Q is a coflasque Γ -module. Thus $\text{Pic } \overline{V}$ is a flasque Γ -module. \square

Lemma 3.3. *Let L be a flasque Γ -module. Then $H^1(\gamma, L) = 0$ for any closed procyclic subgroup $\gamma \subset \Gamma$.*

Proof. Let $Q = L^\vee$, then Q is a coflasque module. Let $\bar{\gamma}$ denote the image of γ in $\text{Aut } L$, it is a finite cyclic group. Since Q is coflasque, $H^1(\bar{\gamma}, Q) = 0$. By duality for Tate cohomology with coefficients in a torsion-free module (cf. [9, Ch. VI, §7, Exercise 3]), we have $H^{-1}(\bar{\gamma}, L) = 0$. By periodicity for Tate cohomology of finite cyclic groups (cf. [1, Ch. IV, Thm. 8.1]) we have $H^1(\bar{\gamma}, L) = 0$. Thus $H^1(\gamma, L) = 0$. \square

Corollary 3.4. ([13, Prop. 3.2]). *Let G be a connected linear algebraic k -group, then $H^1(\gamma, \text{Pic } \overline{V}_G) = 0$ for any closed procyclic subgroup $\gamma \subset \text{Gal}(\bar{k}/k)$.*

Proof. The corollary follows from Theorem 3.2 and Lemma 3.3. \square

Theorem 3.5. *There exists a canonical isomorphism of functors $G \mapsto \mathcal{H}(F_G)$ and $G \mapsto \mathcal{H}(S_G)$ from the category of connected linear algebraic k -groups to the category of abelian groups.*

Corollary 3.6. *$\mathcal{H}(F_G)$ is a stably k -birational invariant of G .*

Proof. The corollary follows from Theorem 3.5 and Proposition 2.14. \square

In the proof of Theorem 3.5 we use the method of Kottwitz [27].

We need the following lemma which was stated in [6] without proof.

Lemma 3.7. *Let $1 \rightarrow G_1 \xrightarrow{\alpha} G_2 \xrightarrow{\beta} G_3 \rightarrow 1$ be an exact sequence of connected reductive k -groups. Then the sequence*

$$1 \rightarrow \pi_1(G_1) \rightarrow \pi_1(G_2) \rightarrow \pi_1(G_3) \rightarrow 1$$

is exact.

Proof. Let $T_2 \subset G_2$ be a maximal torus, $T_3 = \beta(T_2) \subset G_3$, $T_1 = \alpha^{-1}(T_2) \subset G_1$. We have a commutative diagram with exact rows

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathbf{X}_*(T_1^{\text{sc}}) & \longrightarrow & \mathbf{X}_*(T_2^{\text{sc}}) & \longrightarrow & \mathbf{X}_*(T_3^{\text{sc}}) \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & \mathbf{X}_*(T_1) & \longrightarrow & \mathbf{X}_*(T_2) & \longrightarrow & \mathbf{X}_*(T_3) \longrightarrow 0 \end{array}$$

where the vertical arrows are injective and $\text{coker}[\mathbf{X}_*(T_i^{\text{sc}}) \rightarrow \mathbf{X}_*(T_i)] = \pi_1(G_i)$ for $i = 1, 2, 3$. Now our lemma follows from the snake lemma. \square

Corollary 3.8. *If G is a reductive k -group and G^{ss} is simply connected, then the map $t: G \rightarrow G^{\text{tor}}$ induces a canonical isomorphism $t_*: \pi_1(G) \xrightarrow{\sim} \mathbf{X}_*(G^{\text{tor}})$.*

Proof. We have an exact sequence $1 \rightarrow G^{\text{ss}} \rightarrow G \rightarrow G^{\text{tor}} \rightarrow 1$, where $\pi_1(G^{\text{ss}}) = 1$ and $\pi_1(G^{\text{tor}}) = \mathbf{X}_*(G^{\text{tor}})$. \square

3.9. We now construct an isomorphism of functors $\xi_G: \mathcal{H}(F_G) \rightarrow \mathcal{H}(S_G)$ for reductive groups G such that G^{ss} is simply connected.

Choose a smooth compactification V_G of G . Consider the exact sequence of Voskresenskii ([41], [42], [44, 4.5])

$$0 \rightarrow \mathbf{X}^*(G) \rightarrow P \rightarrow \text{Pic } \bar{V}_G \rightarrow \text{Pic } \bar{G} \rightarrow 0,$$

where P is a permutation module. We have $\mathbf{X}^*(G) = \mathbf{X}^*(G^{\text{tor}})$. Since G^{ss} is simply connected, we have $\text{Pic } \bar{G} = 0$ (cf. [39, 6.9, 6.11]). We thus obtain an exact sequence of torsion-free Γ -modules

$$0 \rightarrow \mathbf{X}^*(G^{\text{tor}}) \rightarrow P \rightarrow \text{Pic } \bar{V}_G \rightarrow 0.$$

The dual exact sequence is

$$(3.1) \quad 0 \rightarrow \mathbf{X}_*(S_G) \rightarrow P' \rightarrow \mathbf{X}_*(G^{\text{tor}}) \rightarrow 0,$$

where P' is a permutation module. By Theorem 3.2, $\text{Pic } \bar{V}_G$ is a flasque module, hence $\mathbf{X}_*(S_G)$ is a coflasque module. By Corollary 3.8, $\mathbf{X}_*(G^{\text{tor}}) = \pi_1(G)$. We see that (3.1) is a coflasque resolution of $\pi_1(G)$. Thus we may take $F_G = S_G$. We obtain an isomorphism $\xi_G: \mathcal{H}(F_G) \xrightarrow{\sim} \mathcal{H}(S_G)$.

3.10. We show that ξ_G does not depend on the choice of a smooth compactification V_G of G .

Let V_1 and V_2 be two smooth compactifications of G . Proposition 2.4 shows that it suffices to consider the case when V_1 dominates V_2 . Let $\lambda: V_1 \rightarrow V_2$ denote the domination morphism. Let S_1 and S_2 be the Néron-Severi tori of V_1 and V_2 , respectively. Then λ induces a homomorphism $\lambda_*: S_1 \rightarrow S_2$ and an isomorphism $\varphi_{12} = \lambda_*: \mathcal{H}(S_1) \rightarrow \mathcal{H}(S_2)$, where φ_{12} is the canonical isomorphism defined in 2.8. Since Voskresenskii's exact sequence is functorial in (G, V_G) , the morphism $\lambda: (G, V_1) \rightarrow (G, V_2)$ induces a morphism of coflasque resolutions

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathbf{X}_*(S_1) & \longrightarrow & P_1 & \longrightarrow & \pi_1(G) \longrightarrow 0 \\ & & \lambda_* \downarrow & & \downarrow & & \parallel \\ 0 & \longrightarrow & \mathbf{X}_*(S_2) & \longrightarrow & P_2 & \longrightarrow & \pi_1(G) \longrightarrow 0 \end{array}$$

where P_1 and P_2 are permutation modules. Thus $\lambda_*: S_1 \rightarrow S_2$ is the morphism of flasque tori corresponding to a morphism of coflasque resolutions of the Γ -module $\pi_1(G)$. In other words, if we set $F_1 = S_1$ and $F_2 = S_2$, then we have a commutative diagram

$$\begin{array}{ccc} \mathcal{H}(S_1) & \xlongequal{\quad} & \mathcal{H}(F_1) \\ \varphi_{12} \downarrow & & \downarrow \varphi_{12} \\ \mathcal{H}(S_2) & \xlongequal{\quad} & \mathcal{H}(F_2) \end{array}$$

where the left vertical arrow is defined in 2.8, while the right vertical arrow is defined in 1.7(iii). Thus the isomorphism ξ_G is well defined (does not depend on the choice of a smooth compactification of G).

One can easily show that ξ_G is functorial in G (using Proposition 2.6 and the fact that Voskresenskii's exact sequence is functorial in (G, V_G)).

3.11. The next step is to extend ξ_G to all connected reductive k -groups. We use the method of z -extensions.

A z -extension of a reductive k -group G is an exact sequence of connected reductive k -groups

$$1 \rightarrow Z \rightarrow H \xrightarrow{\beta} G \rightarrow 1$$

such that H^{ss} is simply connected and Z is a quasi-trivial k -torus. By a lemma of Langlands, cf. [34, Prop. 3.1], every reductive k -group admits a z -extension.

We need two lemmas.

Lemma 3.12. *Let*

$$1 \rightarrow G_1 \rightarrow G_2 \xrightarrow{\beta} G_3 \rightarrow 1$$

be an exact sequence of connected linear k -groups. Assume that G_1 is k -rational and that $H^1(K, G_1) = 1$ for any field extension K/k . Then $\beta_*: \mathcal{H}(S_{G_2}) \rightarrow \mathcal{H}(S_{G_3})$ is an isomorphism of abelian groups.

Proof. Since $H^1(K, G_1) = 0$ for any field extension K/k , in particular for $K = k(G_3)$, the epimorphism β admits a rational section $s: U_3 \rightarrow U_2$, where U_3 is an open subset in G_3 and $U_2 = \beta^{-1}(U_3)$. Let $\beta': U_2 \rightarrow U_3$ be the map induced by β , then $\beta' \circ s = \text{id}_{U_3}$. We define an isomorphism of k -varieties

$$\lambda: U_3 \times G_1 \rightarrow U_2, \quad (g_3, g_1) \mapsto s(g_3)g_1$$

(we assume that $G_1 \subset G_2$). By [15, Lemme 11] we have $\text{Pic}(\overline{V}_{U_3} \times \overline{V}_{G_1}) = \text{Pic} \overline{V}_{U_3} \oplus \text{Pic} \overline{V}_{G_1}$, hence λ induces an isomorphism $\mathcal{H}(S_{U_3}) \times \mathcal{H}(S_{G_1}) \rightarrow \mathcal{H}(S_{U_2})$. Since G_1 is a k -rational variety, S_G is a quasi-trivial torus, and $\mathcal{H}(S_{G_1}) = 0$. We see that s induces an isomorphism $s_*: \mathcal{H}(S_{U_3}) \rightarrow \mathcal{H}(S_{U_2})$. Since $\beta' \circ s = \text{id}_{U_3}$, we have $\beta'_* \circ s_* = \text{id}$. We see that $\beta'_*: \mathcal{H}(S_{U_2}) \rightarrow \mathcal{H}(S_{U_3})$ is an isomorphism.

Consider the commutative diagrams

$$\begin{array}{ccc} U_2 & \xrightarrow{i_2} & G_2 & & \mathcal{H}(S_{U_2}) & \xrightarrow{i_{2*}} & \mathcal{H}(S_{G_2}) \\ \beta' \downarrow & & \downarrow \beta & & \beta'_* \downarrow & & \downarrow \beta_* \\ U_3 & \xrightarrow{i_3} & G_3 & & \mathcal{H}(S_{U_3}) & \xrightarrow{i_{3*}} & \mathcal{H}(S_{G_3}) \end{array}$$

where i_2 and i_3 are the inclusions. Clearly i_{2*} and i_{3*} in the right diagram are isomorphisms (we may take $V_{U_2} = V_{G_2}$ and $V_{U_3} = V_{G_3}$). We have proved that β'_* is an isomorphism, hence β_* is an isomorphism. \square

Corollary 3.13. *Let $H \xrightarrow{\beta} G$ be a z -extension with kernel Z . Then $\beta_*: \mathcal{H}(S_H) \rightarrow \mathcal{H}(S_G)$ is an isomorphism of abelian groups.*

Corollary 3.14. *Let G be a connected k -group, $r: G \rightarrow G^{\text{red}}$ the canonical epimorphism. Then the induced homomorphism $r_*: \mathcal{H}(S_G) \rightarrow \mathcal{H}(S_{G^{\text{red}}})$ is an isomorphism.*

Lemma 3.15. *Let $H \xrightarrow{\beta} G$ be a z -extension with kernel Z . Then $\beta_*: \mathcal{H}(F_H) \rightarrow \mathcal{H}(F_G)$ is an isomorphism of abelian groups.*

Proof. By Lemma 3.7 we have an exact sequence

$$0 \rightarrow \mathbf{X}_*(Z) \rightarrow \pi_1(H) \xrightarrow{\beta_*} \pi_1(G) \rightarrow 0.$$

Let

$$0 \rightarrow Q_G \rightarrow P_G \rightarrow \pi_1(G) \rightarrow 0$$

be a coflasque resolution of $\pi_1(G)$. Set $P = P_G \times_{\pi_1(G)} \pi_1(H)$. We have exact sequences

$$(3.2) \quad 0 \rightarrow \mathbf{X}_*(Z) \rightarrow P \xrightarrow{p_G} P_G \rightarrow 0,$$

$$(3.3) \quad 0 \rightarrow Q_G \rightarrow P \xrightarrow{p_H} \pi_1(H) \rightarrow 0,$$

where p_G and p_H are the projections. Since $\mathbf{X}_*(Z)$ and P_G are permutation modules, the sequence (3.2) splits. Therefore P is a permutation module, and (3.3) is a coflasque resolution of $\pi_1(H)$.

Consider the morphism of resolutions (β_*, p_G) :

$$\begin{array}{ccccccc} 0 & \longrightarrow & Q_G & \longrightarrow & P & \xrightarrow{p_H} & \pi_1(H) & \longrightarrow & 0 \\ & & \downarrow & & \downarrow p_G & & \downarrow \beta_* & & \\ 0 & \longrightarrow & Q_G & \longrightarrow & P_G & \longrightarrow & \pi_1(G) & \longrightarrow & 0 \end{array}$$

Clearly $p_G|_{Q_G}: Q_G \rightarrow Q_G$ is the identity map. Thus the induced homomorphism $\mathcal{H}(F_H) \rightarrow \mathcal{H}(F_G)$ is an isomorphism. \square

We shall use the following lemma.

Lemma 3.16. ([27, Lemma 2.4.4]) *Let $G_1 \rightarrow G_2$ be a homomorphism of connected reductive k -groups, and let $H_i \rightarrow G_i$ ($i = 1, 2$) be z -extensions. Then there exists a commutative diagram*

$$\begin{array}{ccccc} H_1 & \longleftarrow & H_3 & \longrightarrow & H_2 \\ \downarrow & & \downarrow & & \downarrow \\ G_1 & \xleftarrow{\text{id}} & G_1 & \longrightarrow & G_2 \end{array}$$

in which the homomorphisms $H_3 \rightarrow H_1$ and $H_3 \rightarrow H_2$ are surjective, and $H_3 \rightarrow G_1$ is a z -extension.

3.17. We can now extend the isomorphism $\xi_G: \mathcal{H}(F_G) \rightarrow \mathcal{H}(S_G)$ to all connected reductive k -groups. Let G be a reductive group. Choose a z -extension $H \xrightarrow{\beta} G$. The isomorphism ξ_H is already defined because H^{ss} is simply connected. We must define ξ_G so that the following diagram of isomorphisms is commutative:

$$\begin{array}{ccc} \mathcal{H}(F_H) & \xrightarrow{\xi_H} & \mathcal{H}(S_H) \\ \beta_* \downarrow & & \downarrow \beta_* \\ \mathcal{H}(F_G) & \xrightarrow{\xi_G} & \mathcal{H}(S_G) \end{array}$$

By Corollary 3.13 and Lemma 3.15, the vertical arrows are isomorphisms, and ξ_G is thus defined. Using Lemma 3.16, one can easily check that our ξ_G does not depend on the choice of a z -extension $H \xrightarrow{\beta} G$ and is functorial in G .

To extend ξ_G to all connected k -groups G , we need a lemma.

Lemma 3.18. *Let G be a connected k -group, $r: G \rightarrow G^{\text{red}}$ the canonical epimorphism. Then the induced homomorphism $r_*: \mathcal{H}(F_G) \rightarrow \mathcal{H}(F_{G^{\text{red}}})$ is an isomorphism.*

Proof. By definition $\pi_1(G) = \pi_1(G^{\text{red}})$, and therefore $\mathcal{H}(F_G) = \mathcal{H}(F_{G^{\text{red}}})$. \square

3.19. We can now extend ξ_G to the category of all connected k -groups G . We must define ξ_G so that the following diagram is commutative:

$$\begin{array}{ccc} \mathcal{H}(F_G) & \xrightarrow{\xi_G} & \mathcal{H}(S_G) \\ r_* \downarrow & & \downarrow r_* \\ \mathcal{H}(F_{G^{\text{red}}}) & \xrightarrow{\xi_{G^{\text{red}}}} & \mathcal{H}(S_{G^{\text{red}}}) \end{array}$$

By Corollary 3.14 and Lemma 3.18, the vertical arrows are isomorphisms, and ξ_G is thus defined. This isomorphism ξ_G is functorial in G .

This completes the proof of Theorem 3.5.

Remark 3.20. (i) Theorem 3.2 generalizes [13, Prop. 3.2]. It was an observation by V. Chernousov that the device of passage to the variety of Borel subgroups can simplify the proof of that proposition. This observation, along with discussions with P. Gille, led us to Theorem 3.2. P. Gille suggested another proof of Theorem 3.2.

(ii) A particular case of Theorem 3.5 (for semisimple groups over number fields) was proved in [21] in the course of the proof of Thm. III.4.3. Discussions with P. Gille around this result led us to Theorem 3.5. P. Gille suggested another proof.

Theorem 3.21. *Set $Q_G = \mathbf{X}_*(F_G)$, then the Γ -modules Q_G and $(\text{Pic } \overline{V}_G)^\vee$ are similar, i.e. $Q_G \oplus P_1 \simeq (\text{Pic } \overline{V}_G)^\vee \oplus P_2$, where P_1 and P_2 are some permutation modules (recall that $(\)^\vee$ denotes the dual module).*

Proof. We have actually proved this while proving Theorem 3.5. Indeed, in 3.9 we proved that for a reductive group G such that G^{ss} is simply connected, we may take $Q_G = (\text{Pic } \overline{V}_G)^\vee$. In the proofs of Corollaries 3.13, 3.14 and Lemmas 3.15 and 3.18 we proved that if G is any connected k -group, then Q_G is similar to Q_H and $(\text{Pic } \overline{V}_G)^\vee$ is similar to $(\text{Pic } \overline{V}_H)^\vee$ for some reductive group H such that H^{ss} is simply connected. \square

Remark 3.22. In Sections 1–3 we assumed that \mathcal{H} is a *covariant* functor only for simplicity. All the results (with evident changes) also hold for an additive *contravariant* functor \mathcal{H} such that $\mathcal{H}(N) = 0$ for any quasi-trivial k -torus N .

Theorem 3.23. *Let G be a connected linear k -group. Then there is a canonical functorial isomorphism*

$$H^1(k, \text{Pic } \overline{V}_G) \simeq H^1(k, Q_G^\vee),$$

where Q_G^\vee is the dual module to Q_G , and Q_G comes from a coflasque resolution

$$0 \rightarrow Q_G \rightarrow P \rightarrow \pi_1(G) \rightarrow 0.$$

Proof. Since $\text{Pic } \overline{V}_G = \mathbf{X}^*(S_G)$ and $Q_G^\vee = \mathbf{X}^*(F_G)$, the theorem follows from Theorem 3.5 applied to the contravariant functor $T \mapsto \mathcal{H}(T) = \mathbf{X}^*(T)$. \square

Corollary 3.24. *Let E be a principal homogeneous space of a connected linear k -group G . Then there is a canonical isomorphism*

$$H^1(k, \text{Pic } \overline{V}_E) \simeq H^1(k, Q_G^\vee).$$

Proof. The functor $X \mapsto \mathcal{F}(X) = H^1(k, \text{Pic } \overline{V}_X)$ on the category of rational k -varieties is additive, i.e. $\mathcal{F}(X_1 \times X_2) = \mathcal{F}(X_1) \oplus \mathcal{F}(X_2)$, cf. [15, Lemme 11, p. 188]. By [39, Lemme 6.4] applied to the functor \mathcal{F} , there is a canonical isomorphism $H^1(k, \text{Pic } \overline{V}_E) \simeq H^1(k, \text{Pic } \overline{V}_G)$, and the corollary follows from Theorem 3.23. \square

Remark 3.25. By Corollary 3.4 and Theorem 3.21 we can write Corollary 3.24 as follows:

$$H^1(k, \text{Pic } \overline{V}_E) \simeq \ker \left[H^1(k, Q_G^\vee) \rightarrow \prod_{\gamma} H^1(\gamma, Q_G^\vee) \right],$$

where γ runs over closed procyclic subgroups of $\text{Gal}(\overline{k}/k)$. From this formula one can deduce the formula of [7, Thm. 2.4].

4. R -EQUIVALENCE

In this section for k as in 0.1 we construct an isomorphism of functors $G(k)/R \rightarrow H^1(k, F_G)$. (Clearly the functor $T \mapsto H^1(k, T)$ on the category of k -tori satisfies conditions (1–3) of Notation and conventions, so we have functors $G \mapsto H^1(k, F_G)$ and $X \mapsto H^1(k, S_X)$ as in Sections 1 and 2.) We start with stating the results of [15] on R -equivalence on tori and the results of [22], [12] on R -equivalence on reductive groups admitting special coverings. We derive some corollaries which will be used below.

4.1. The notion of R -equivalence was introduced by Manin [31]. Let X be an algebraic variety over a field k . We say that two points $x, y \in X(k)$ are elementarily related if there exists a rational map f of the projective line \mathbf{P}^1 to X such that f is defined in 0 and 1 and $f(0) = x$, $f(1) = y$. Two points x, y are called R -equivalent if there exists a finite sequence of points $x_0 = x, x_1, \dots, x_n = y$ such that x_i is elementarily related to x_{i-1} for $i = 1, \dots, n$. We denote by $X(k)/R$ the set of equivalence classes in $X(k)$. If G is a connected linear algebraic group over k , then the set $G(k)/R$ has a natural group structure.

4.2. Let T be a k -torus. Let

$$(R) \quad 0 \rightarrow Q \rightarrow P \rightarrow \mathbf{X}_*(T) \rightarrow 0$$

be a coflasque resolution. Let

$$1 \rightarrow F_T \rightarrow N \rightarrow T \rightarrow 1$$

be the corresponding exact sequence of tori, where $\mathbf{X}_*(N) = P$ and $\mathbf{X}_*(F_T) = Q$. Consider the exact sequence

$$N(k) \rightarrow T(k) \xrightarrow{\delta_T} H^1(k, F_T) \rightarrow H^1(k, N) = 0.$$

Theorem 4.3. ([15, Thm. 2, p. 199]) *The map δ_T induces an isomorphism $\delta_{T*}: T(k)/R \xrightarrow{\sim} H^1(k, F_T)$.*

Corollary 4.4. *The collection of isomorphisms $\delta_{T*}: T(k)/R \xrightarrow{\sim} H^1(k, F_T)$ is an isomorphism of functors (from k -tori to abelian groups).*

Proof. Easy diagram chasing. □

Let now k be as in 0.1. Let G be a connected linear k -group. In the case (gl) we always assume that G has no factors of type E_8 .

We say that a connected k -group G admits a special covering if G is reductive and there is an exact sequence

$$1 \rightarrow \mu \rightarrow G' \rightarrow G \rightarrow 1$$

with μ finite and G' the product of a semisimple simply connected group and a quasi-trivial torus.

Theorem 4.5. [22], [12, Thm. 4.12] *Let k be as in 0.1. Let G be a connected reductive k -group admitting a special covering. In the (gl) case, assume that G contains no factor of type E_8 . Let*

$$1 \rightarrow \mu \rightarrow F \rightarrow N \rightarrow 1$$

be a flasque resolution of μ (i.e. F is a flasque torus and N is a quasi-trivial torus). Then the Galois cohomology sequences induce an isomorphism of groups $G(k)/R \simeq H^1(k, F)$.

Corollary 4.6. *Under the hypotheses of Theorem 4.5, suppose that $f: G_1 \rightarrow G_2$ is a homomorphism of k -groups admitting special coverings, and assume that f extends to a morphism of coverings*

$$\begin{array}{ccccccc} 1 & \longrightarrow & \mu_1 & \longrightarrow & G'_1 & \longrightarrow & G_1 \longrightarrow 1 \\ & & \downarrow \varphi & & \downarrow \psi & & \downarrow f \\ 1 & \longrightarrow & \mu_2 & \longrightarrow & G'_2 & \longrightarrow & G_2 \longrightarrow 1 \end{array}$$

where $\varphi: \mu_1 \rightarrow \mu_2$ is an isomorphism. Then the induced homomorphism $f_: G_1(k)/R \rightarrow G_2(k)/R$ is an isomorphism.*

Idea of proof. We can choose flasque resolutions

$$1 \rightarrow \mu_i \rightarrow F_i \rightarrow N_i \rightarrow 1 \quad (i = 1, 2)$$

so that φ extends to an isomorphism of resolutions

$$\begin{array}{ccccccc} 1 & \longrightarrow & \mu_1 & \longrightarrow & F_1 & \longrightarrow & N_1 \longrightarrow 1 \\ & & \downarrow \varphi & & \downarrow \alpha & & \downarrow \beta \\ 1 & \longrightarrow & \mu_2 & \longrightarrow & F_2 & \longrightarrow & N_2 \longrightarrow 1 \end{array}$$

(i.e., φ , α and β are isomorphisms). □

4.7. We can now state and prove our main result on R -equivalence on groups over a field k as in 0.1.

Let k be a field of characteristic 0. Consider two functors from the category of connected linear algebraic k -groups to the category of abelian groups: $G \mapsto G(k)/R$ and $G \mapsto H^1(k, F_G)$ (the latter functor was introduced in 1.9). The collection of maps δ_{T^*} of Theorem 4.3 is an isomorphism of these functors on the category of k -tori.

Theorem 4.8. *Assume that k is as in 0.1. In the (gl) case assume that G has no E_8 -factors. Then the isomorphism of functors δ_{T^*} extends uniquely to an isomorphism of functors $\theta_G: G(k)/R \rightarrow H^1(k, F_G)$.*

Corollary 4.9. *For k and G as in Theorem 4.8, if the image of $\text{Gal}(\bar{k}/k)$ in $\text{Aut } \pi_1(G)$ is a metacyclic group, then $G(k)/R = 1$.*

Proof. The corollary follows from Theorem 4.8 and Proposition 1.10. \square

Corollary 4.10. *Let k and G be as in Theorem 4.8, then*

- (i) *there is a canonical isomorphism $G(k)/R \simeq H^1(k, S_G)$;*
- (ii) *the group $G(k)/R$ is a stably k -birational invariant of G .*

Proof. The corollary follows from Theorem 4.8, Theorem 3.5, and Proposition 2.14. \square

Remark 4.11. (i) It is clear that the set $G(k)/R$ is a stably k -birational invariant of G , but it is not clear *a priori* that the group $G(k)/R$ is a stably k -birational invariant of G , cf. [15, p. 201].

(ii) Let k, G_1, G_2 be as in Theorem 4.8, and let $f: G_1 \rightarrow G_2$ be a rational map defined over k . In other words, we are given open subvarieties $U_\nu \subset G_\nu$ ($\nu = 1, 2$) and a regular map $f': U_1 \rightarrow U_2$, all defined over k . The map f' induces a map $f'_*: U_1(k)/R \rightarrow U_2(k)/R$. Let $i_\nu: U_\nu \rightarrow G_\nu$ denote the inclusions, then $i_{\nu*}: U_\nu(k)/R \rightarrow G_\nu(k)/R$ are bijections, cf. [15, Prop. 11]. We identify $U_\nu(k)/R$ with $G_\nu(k)/R$ using $i_{\nu*}$ ($\nu = 1, 2$). Then we obtain a map $f_*: G_1(k)/R \rightarrow G_2(k)/R$. On the other hand, in 2.13 we constructed the induced homomorphism $f_*: H^1(k, S_{G_1}) \rightarrow H^1(k, S_{G_2})$. By Corollary 4.10(i) we have canonical isomorphisms $G_\nu(k)/R \rightarrow H^1(k, S_{G_\nu})$ ($\nu = 1, 2$). However in general the diagram

$$\begin{array}{ccc} G_1(k)/R & \xrightarrow{f_*} & G_2(k)/R \\ \downarrow & & \downarrow \\ H^1(k, S_{G_1}) & \xrightarrow{f_*} & H^1(k, S_{G_2}) \end{array}$$

is *not* commutative! For example take $G_1 = G_2 = G$, and let f be a left translation, i.e $f(g) = ag$ ($g \in G$) for a fixed element $a \in G(k)$. Then $f_*: G(k)/R \rightarrow G(k)/R$ may take the identity element to another element, while $f_*: H^1(k, S_G) \rightarrow H^1(k, S_G)$ is an isomorphism of abelian groups.

(iii) Corollary 4.9 and the similar corollaries below (Corollary 5.11 and Corollary 7.8) generalize results of [12] (Cor. 4.11(iv), Cor. 4.14(iv), and Thm. 5.2(b)(i)) proved for *semisimple* groups splitting over a metacyclic extension.

To prove Theorem 4.8 we need some lemmas.

Lemma 4.12. *Let k be as in 0.1. Let G be a reductive group such that G^{ss} is simply connected. Then the map $G(k) \rightarrow G^{\text{tor}}(k)$ induces an isomorphism $G(k)/R \rightarrow G^{\text{tor}}(k)/R$.*

Proof. We give two proofs.

First proof. See the Appendix by P. Gille, Theorem 1(b).

Second proof (with the help of J.-L. Colliot-Thélène). (i) First assume that G admits a special covering

$$1 \rightarrow \mu \rightarrow G_0 \times N \rightarrow G \rightarrow 1,$$

where G_0 is a simply connected group and N is a quasi-trivial torus. Since G^{ss} is simply connected, we see that $\mu \cap G_0 = 1$. We have a commutative diagram with exact rows

$$\begin{array}{ccccccccc} 1 & \longrightarrow & \mu & \longrightarrow & G_0 \times N & \longrightarrow & G & \longrightarrow & 1 \\ & & \downarrow & & \downarrow & & \downarrow & & \\ 1 & \longrightarrow & \mu^t & \longrightarrow & N & \longrightarrow & G^{\text{tor}} & \longrightarrow & 1 \end{array}$$

where $\mu \rightarrow \mu^t$ is an isomorphism. Hence by Corollary 4.6 we get an isomorphism $G(k)/R \rightarrow G^{\text{tor}}(k)/R$.

(ii) Let now G be any reductive k -group such that G^{ss} is simply connected. By [39, Lemme 1.10] there exist a natural number m and a quasi-trivial torus T such that $G^m \times T$ admits a special covering. Clearly $(G^m \times T)^{\text{ss}}$ is simply connected. By (i),

$$(G^m \times T)(k)/R \rightarrow ((G^m)^{\text{tor}} \times T)(k)/R$$

is an isomorphism. Thus $(G(k)/R)^m \rightarrow (G^{\text{tor}}(k)/R)^m$ is an isomorphism, and $G(k)/R \rightarrow G^{\text{tor}}(k)/R$ is an isomorphism. \square

Lemma 4.13. *Let k be a field of characteristic 0 and let G be a connected reductive k -group such that G^{ss} is simply connected. Then the map $t: G \rightarrow G^{\text{tor}}$ induces an isomorphism $t_*: H^1(k, F_G) \rightarrow H^1(k, F_{G^{\text{tor}}})$.*

Proof. By Lemma 3.7, $\pi_1(G) \simeq \pi_1(G^{\text{tor}})$, and the lemma follows. \square

4.14. We can now extend the isomorphism $\theta_G: G(k)/R \rightarrow H^1(k, F_G)$ from the category of k -tori to the category of reductive k -groups G such that G^{ss} is simply connected. Namely, we must define an isomorphism $\theta_G: G(k)/R \rightarrow H^1(k, F_G)$ so that the following diagram is commutative:

$$\begin{array}{ccc} G(k)/R & \xrightarrow{\theta_G} & H^1(k, F_G) \\ t_* \downarrow & & \downarrow t_* \\ G^{\text{tor}}(k)/R & \xrightarrow{\theta_{G^{\text{tor}}}} & H^1(k, F_{G^{\text{tor}}}) \end{array}$$

where $t: G \rightarrow G^{\text{tor}}$ is the canonical epimorphism. Here the left vertical arrow is an isomorphism by Lemma 4.12, and the right vertical arrow is an isomorphism by Lemma 4.13. Thus θ_G is defined.

The next step is to extend θ_G to all connected reductive k -groups. We use the method of z -extensions. We need a lemma.

Lemma 4.15. *Let k be a field of characteristic 0 and let*

$$1 \rightarrow G_1 \rightarrow G_2 \xrightarrow{\beta} G_3 \rightarrow 1$$

be an exact sequence of connected linear k -groups. Assume that $G_1(k)/R = 1$ and that $H^1(K, G_1) = 1$ for any field extension K/k . Then $\beta_: G_2(k)/R \rightarrow G_3(k)/R$ is a group isomorphism.*

Proof. The map β_* is clearly a group homomorphism. We wish to prove that β_* is bijective.

Since $H^1(K, G_1) = 0$ for any field extension K/k , the epimorphism β admits a rational section $s: U_3 \rightarrow U_2$, where U_3 is an open subset in G_3 and $U_2 = \beta^{-1}(U_3)$. Let $\beta': U_2 \rightarrow U_3$ be the map induced by β , then $\beta' \circ s = \text{id}_{U_3}$. As in the proof of Lemma 3.12, we define an isomorphism of k -varieties

$$\lambda: U_3 \times G_1 \rightarrow U_2, \quad (g_3, g_1) \mapsto s(g_3)g_1$$

(we assume that $G_1 \subset G_2$). Then λ induces a bijection $U_3(k)/R \times G_1(k)/R \rightarrow U_2(k)/R$. By assumption $G_1(k)/R = 1$. We see that s induces a bijection $s_*: U_3(k)/R \rightarrow U_2(k)/R$. Since $\beta' \circ s = \text{id}_{U_3}$, we have $\beta'_* \circ s_* = \text{id}$. We see that $\beta'_*: U_2(k)/R \rightarrow U_3(k)/R$ is a bijection.

Consider the commutative diagrams

$$\begin{array}{ccc} U_2 & \xrightarrow{i_2} & G_2 \\ \beta' \downarrow & & \downarrow \beta \\ U_3 & \xrightarrow{i_3} & G_3 \end{array} \quad \begin{array}{ccc} U_2(k)/R & \xrightarrow{i_{2*}} & G_2(k)/R \\ \beta'_* \downarrow & & \downarrow \beta_* \\ U_3(k)/R & \xrightarrow{i_{3*}} & G_3(k)/R \end{array}$$

where i_2 and i_3 are the inclusions. By [15, Prop. 11] i_{2*} and i_{3*} in the right diagram are bijections. We have proved that β'_* is a bijection, hence β_* is a bijection. We conclude that β_* is a group isomorphism. \square

Corollary 4.16. *Let $H \xrightarrow{\beta} G$ be a z -extension with kernel Z . Then $\beta_*: H(k)/R \rightarrow G(k)/R$ is an isomorphism of groups.*

Corollary 4.17. *Let G be a connected k -group. Then the homomorphism $r_*: G(k)/R \rightarrow G^{\text{red}}(k)/R$ is an isomorphism.*

4.18. We can now extend the isomorphism $\theta_G: G(k)/R \rightarrow H^1(k, F_G)$ to all reductive k -groups. The construction is similar to that of 3.17. We choose a z -extension $H \xrightarrow{\beta} G$. We must define θ_G so that the following diagram is commutative:

$$\begin{array}{ccc} H(k)/R & \xrightarrow{\theta_H} & H^1(k, F_H) \\ \beta_* \downarrow & & \downarrow \beta_* \\ G(k)/R & \xrightarrow{\xi_G} & H^1(k, F_G) \end{array}$$

Here the left vertical arrow is an isomorphism by Corollary 4.16, and the right vertical arrow is an isomorphism by Lemma 3.15. As in 3.17, using Lemma 3.16, one can easily check that our θ_G does not depend on the choice of the z -extension $H \xrightarrow{\beta} G$ and is functorial in G .

4.19. We extend θ_G to all connected k -groups. We denote by $r: G \rightarrow G^{\text{red}}$ the canonical epimorphism. Using Corollary 4.17 and Lemma 3.18, we can construct θ_G for any connected k -group G so that the following diagram is commutative:

$$\begin{array}{ccc} G(k)/R & \xrightarrow{\theta_G} & H^1(k, F_G) \\ r_* \downarrow & & \downarrow r_* \\ G^{\text{red}}(k)/R & \xrightarrow{\theta_{G^{\text{red}}}} & H^1(k, F_{G^{\text{red}}}) \end{array}$$

This isomorphism θ_G is functorial in G .

Theorem 4.8 is completely proved.

Remark 4.20. Theorem 4.8 also holds when k is a non-archimedean local field of characteristic 0 or a totally imaginary number field. The assertion similar to Theorem 4.5 was proved for such fields by Gille (in [21, III.2.7] for local fields and in [21, III.4.1(1)] for totally imaginary number fields).

4.21. We now show how one can derive the formula of Theorem 4.5 from the formula of Theorem 4.8.

Let k be a field of characteristic 0, G a reductive k -group admitting a special covering

$$1 \rightarrow \mu \rightarrow G_0 \times N_0 \xrightarrow{\alpha} G \rightarrow 1$$

where G_0 is a simply connected group and N_0 is a quasi-trivial torus. We identify G_0 with G^{sc} . Let

$$(4.1) \quad 1 \rightarrow \mu \rightarrow F \rightarrow N \rightarrow 1$$

be a flasque resolution of μ , i.e. F is a flasque torus and N is a quasi-trivial torus. We wish to construct a coflasque resolution of $\pi_1(G)$ of the form

$$0 \rightarrow \mathbf{X}_*(F) \rightarrow P \rightarrow \pi_1(G) \rightarrow 0$$

where P is a permutation module. Then we may take $F_G = F$, hence $H^1(k, F_G) = H^1(k, F)$.

Let $T \subset G$ be a maximal torus. We obtain an exact sequence

$$1 \rightarrow \mu \rightarrow T^{\text{sc}} \times N_0 \rightarrow T \rightarrow 1$$

where $T^{\text{sc}} \times N_0 = \alpha^{-1}(T)$ and T^{sc} is a maximal torus of G^{sc} . Going over to cocharacters, we obtain an exact sequence of Γ -modules (cf. [21, Lemme A.3])

$$0 \rightarrow \mathbf{X}_*(T^{\text{sc}}) \oplus \mathbf{X}_*(N_0) \rightarrow \mathbf{X}_*(T) \rightarrow \mu(-1) \rightarrow 0.$$

We now factor out $\mathbf{X}_*(T^{\text{sc}})$ taking into account the definition of $\pi_1(G)$ (see 1.8). We obtain an exact sequence

$$0 \rightarrow \mathbf{X}_*(N_0) \rightarrow \pi_1(G) \rightarrow \mu(-1) \rightarrow 0.$$

Going over to cocharacters in (4.1), we obtain

$$0 \rightarrow \mathbf{X}_*(F) \rightarrow \mathbf{X}_*(N) \rightarrow \mu(-1) \rightarrow 0.$$

Let $P = \pi_1(G) \times_{\mu(-1)} \mathbf{X}_*(N)$ be the fibered product. We obtain exact sequences

$$(4.2) \quad 0 \rightarrow \mathbf{X}_*(N_0) \rightarrow P \rightarrow \mathbf{X}_*(N) \rightarrow 0$$

$$(4.3) \quad 0 \rightarrow \mathbf{X}_*(F) \rightarrow P \rightarrow \pi_1(G) \rightarrow 0$$

Sequence (4.2) splits because $\mathbf{X}_*(N_0)$ and $\mathbf{X}_*(N)$ are permutation modules (cf. [29, Prop. 1.2]), hence P is a permutation module. Thus sequence (4.3) is a required coflasque resolution.

5. WEAK APPROXIMATION

In this section we compute $A_\Sigma(G)$ where G is a field of type (gl) or (ll). But first we consider weak approximation in a more general setting.

5.1. Let k be a field of characteristic 0. Let Σ be a finite set of non-equivalent absolute values on k , cf. [28, Ch. XII, §1]. For $v \in \Sigma$ let k_v denote the completion of k with respect to v . Let G be a connected linear k -group. We set $k_\Sigma = \prod_{v \in \Sigma} k_v$, then $G(k_\Sigma) = \prod_{v \in \Sigma} G(k_v)$. Let $\overline{G(k)}$ denote the closure of the image of $G(k)$ under the diagonal embedding $G(k) \rightarrow G(k_\Sigma)$. We say that G has the weak approximation property with respect to Σ if $G(k)$ is dense in $G(k_\Sigma)$, i.e. $\overline{G(k)} = G(k_\Sigma)$.

Proposition 5.2. (Stated in [35, Prop. 1.3].) *Let k , Σ , G be as in 5.1. Then $\overline{G(k)}$ is an open subgroup of $G(k_\Sigma)$.*

Proof. Since $\text{char}(k) = 0$, G is a k -unirational variety, cf. [2, Thm. 18.2(ii)]. It follows that there exists a smooth morphism of k -varieties $\lambda: U \rightarrow G$, where U is an open subvariety in \mathbf{P}_k^n for some n . We have $\overline{U(k)} = U(k_\Sigma)$. Since λ is a smooth morphism, the map $\lambda_v: U(k_v) \rightarrow G(k_v)$ is open for each v , cf. [23, Satz 1.1.1], hence the map $\lambda: U(k_\Sigma) \rightarrow G(k_\Sigma)$ is open. We see that the set $\lambda(U(k_\Sigma))$ is open in $G(k_\Sigma)$.

We have $\overline{G(k)} \supset \overline{\lambda(U(k))} \supset \lambda(\overline{U(k)}) = \lambda(U(k_\Sigma))$. We see that the subgroup $\overline{G(k)}$ of $G(k_\Sigma)$ contains the open set $\lambda(U(k_\Sigma))$. It follows that the subgroup $\overline{G(k)}$ is open in $G(k_\Sigma)$. \square

Proposition 5.3. [35, Prop. 1.4] *Let k , Σ , and G be as in 5.1. Assume that $\overline{G^{\text{sc}}(k)} = G^{\text{sc}}(k_\Sigma)$. Then the closure $\overline{G(k)}$ of $G(k)$ in $G(k_\Sigma)$ is a normal subgroup, and the quotient $A_\Sigma(G) := G(k_\Sigma)/\overline{G(k)}$ is an abelian group.*

Proof. We use an idea of [26, Proof of Satz 6.1]. It suffices to prove that $\overline{G(k)}$ contains the commutator subgroup of $G(k_\Sigma)$.

First we assume that G is reductive. Consider the homomorphism $\rho: G^{\text{sc}} \rightarrow G$. By [26, Hilfssatz 6.2] (see also [18, 2.0.3]) the commutator subgroup $[G(k_v), G(k_v)]$ is contained in $\rho(G^{\text{sc}}(k_v))$ for each v . It follows that $[G(k_\Sigma), G(k_\Sigma)]$ is contained in $\rho(G^{\text{sc}}(k_\Sigma))$. But $G^{\text{sc}}(k_\Sigma) = \overline{G^{\text{sc}}(k)}$ by assumption. Since $\rho(\overline{G^{\text{sc}}(k)}) \subset \overline{G(k)}$, we conclude that $[G(k_\Sigma), G(k_\Sigma)] \subset \overline{G(k)}$, which was to be proved.

We now consider the case of general G (not necessarily reductive). Consider the canonical map $r: G \rightarrow G^{\text{red}}$. Let $s: G^{\text{red}} \rightarrow G$ be the splitting corresponding to a Levi decomposition $G \simeq G^{\text{u}} \rtimes G^{\text{red}}$. Then $G(k) = G^{\text{u}}(k) \cdot s(G^{\text{red}}(k))$. Clearly we have $\overline{G(k)} = \overline{G^{\text{u}}(k)} \cdot \overline{s(G^{\text{red}}(k))}$. Since G^{u} is k -rational, $\overline{G^{\text{u}}(k)} = G^{\text{u}}(k_\Sigma)$, hence $\overline{G(k)} = G^{\text{u}}(k_\Sigma) \cdot \overline{s(G^{\text{red}}(k))}$. Clearly $r^{-1}(\overline{G^{\text{red}}(k)}) = G^{\text{u}}(k_\Sigma) \cdot s(\overline{G^{\text{red}}(k)})$, and therefore $r^{-1}(\overline{G^{\text{red}}(k)}) = \overline{G(k)}$. Since $[G^{\text{red}}(k_\Sigma), G^{\text{red}}(k_\Sigma)] \subset \overline{G^{\text{red}}(k)}$, we conclude that $[G(k_\Sigma), G(k_\Sigma)] \subset \overline{G(k)}$, which was to be proved. \square

5.4. Let now k be a field of one of types (ll) or (gl). Let Ω denote the associated set of discrete valuations of k , see [12, §1]. Let $\Sigma \subset \Omega$ be a finite subset. Let G be a connected linear k -group. In the case (gl) assume that G has no E_8 -factor. By [12, Thm. 4.7] $G^{\text{sc}}(k)$ is dense in $G^{\text{sc}}(k_\Sigma)$. By Proposition 5.3 $\overline{G(k)}$ is a normal subgroup of $G(k_\Sigma)$, and the quotient $A_\Sigma(G) := G(k_\Sigma)/\overline{G(k)}$ is an abelian group (this was earlier proved in [12, Thm. 4.13(i)]).

Lemma 5.5. *Let k and Σ be as in 5.4, and let*

$$1 \rightarrow G_1 \rightarrow G_2 \xrightarrow{\beta} G_3 \rightarrow 1$$

be an exact sequence of connected linear k -groups. Assume that $H^1(k, G_1) = 1$, $H^1(k_v, G_1) = 1$ for each $v \in \Sigma$. Assume that G_1 has the weak approximation property with respect to Σ . Then the induced homomorphism $\beta_: A_\Sigma(G_2) \rightarrow A_\Sigma(G_3)$ is an isomorphism.*

Proof. We use an idea of [36, Proof of Lemma 3.8]. First we prove that $\beta(\overline{G_2(k)}) = \overline{G_3(k)}$. By Lemma 5.2 $\overline{G_2(k)}$ is open in $G_2(k_\Sigma)$. Since the homomorphism $\beta: G_2 \rightarrow G_3$ is surjective, it is a smooth morphism, hence the map $\beta: G_2(k_\Sigma) \rightarrow G_3(k_\Sigma)$ is open (cf. [23, Satz 1.1.1]), and therefore the group $\beta(\overline{G_2(k)})$ is open in $G_3(k_\Sigma)$. But any open subgroup of a topological group is closed, hence the group $\beta(\overline{G_2(k)})$ is closed in $G_3(k_\Sigma)$. Since $H^1(k, G_1) = 1$, we have $\beta(G_2(k)) = G_3(k)$, hence $\beta(\overline{G_2(k)}) \supset G_3(k)$. Thus $\beta(\overline{G_2(k)})$ is a closed subgroup of $G_3(k_\Sigma)$ containing $G_3(k)$, and we see that $\beta(\overline{G_2(k)}) = \overline{G_3(k)}$.

Next we prove that $\beta^{-1}(\overline{G_3(k)}) = \overline{G_2(k)}$. Let $g_2 \in G_2(k_\Sigma)$ be such that $\beta(g_2) \in \overline{G_3(k)}$. Then there exists $g'_2 \in \overline{G_2(k)}$ such that $\beta(g'_2) = \beta(g_2)$. We have $g_2(g'_2)^{-1} \in G_1(k_\Sigma)$ (we assume that $G_1 \subset G_2$). By assumption $G_1(k_\Sigma) = \overline{G_1(k)}$, hence $g_2 \in \overline{G_1(k)} \cdot \overline{G_2(k)} = \overline{G_2(k)}$. Thus $\beta^{-1}(\overline{G_3(k)}) = \overline{G_2(k)}$.

Consider the homomorphism of abelian groups $\beta_*: A_\Sigma(G_2) \rightarrow A_\Sigma(G_3)$. We prove that β_* is bijective. Since $H^1(k_v, G_1) = 1$ for each $v \in \Sigma$, we have $\beta(G_2(k_\Sigma)) = G_3(k_\Sigma)$, hence β_* is surjective. Since $\beta^{-1}(\overline{G_3(k)}) = \overline{G_2(k)}$, the map β_* is injective. Thus β_* is bijective. \square

Corollary 5.6. *Let k and Σ be as in 5.4, and let*

$$1 \rightarrow G_1 \rightarrow G_2 \xrightarrow{\beta} G_3 \rightarrow 1$$

be an exact sequence of connected linear k -groups. If G_1 is a quasi-trivial torus or a unipotent group, then $\beta_: A_\Sigma(G_2) \rightarrow A_\Sigma(G_3)$ is an isomorphism.* \square

Proof. The corollary follows from Lemma 5.5. We give another proof. We use the fact that β admits a rational section.

Since $H^1(K, G_1) = 1$ for any field extension K/k , the map β admits a rational section. This means that there exist a Zariski open subset $U_3 \subset G_3$ and a regular map $s: U_3 \rightarrow U_2$, where $U_2 = \beta^{-1}(U_3)$, such that $\beta|_{U_2} \circ s = \text{id}_{U_3}$ (all defined over k).

Let $g_3 \in G_3(k)$. Since $H^1(k, G_1) = 1$, there exists $g_2 \in G_2(k)$ such that $g_3 = \beta(g_2)$. Consider the open set g_3U_3 and define a map $g_{2*}s: g_3U_3 \rightarrow g_2U_2$ by

$$(g_{2*}s)(x) = g_2s(g_3^{-1}x) \quad (x \in g_3U_3).$$

Clearly $\beta|_{g_2U_2} \circ g_{2*}s = \text{id}_{g_3U_3}$, i.e. $g_{2*}s$ is a rational section of β .

We prove that $\overline{G_3(k)} \subset \beta(\overline{G_2(k)})$. Let $g_{3\Sigma} \in \overline{G_3(k)} \subset G_3(k_\Sigma)$. Using the fact that $G_3(k)$ is Zariski dense in G_3 , one can show that there exists $g_3 \in G_3(k)$ such that $g_{3\Sigma} \in \overline{(g_3U_3)(k_\Sigma)}$. We shall write U_3 instead of g_3U_3 and s instead of $g_{2*}s$. Set $g_{2\Sigma} = s(g_{3\Sigma})$. Since $g_{3\Sigma} \in \overline{G_3(k)}$, we have $g_{3\Sigma} \in \overline{U_3(k)}$, and $g_{2\Sigma} \in s(\overline{U_3(k)}) \subset \overline{G_2(k)}$. Thus $\overline{G_3(k)} \subset \beta(\overline{G_2(k)})$.

Next, using the fact that $G_1(k_\Sigma) = \overline{G_1(k)}$ (because G_1 is k -rational), we can prove that $\beta^{-1}(\overline{G_3(k)}) = \overline{G_2(k)}$. It follows that the map $\beta_*: A_\Sigma(G_2) \rightarrow A_\Sigma(G_3)$ is injective.

Since $H^1(k_v, G_1) = 1$ for any $v \in \Sigma$, the map $\beta: G_2(k_\Sigma) \rightarrow G_3(k_\Sigma)$ is surjective, hence $\beta_*: A_\Sigma(G_2) \rightarrow A_\Sigma(G_3)$ is surjective. Thus β_* is bijective. \square

Corollary 5.7. *Let k , Σ and G be as in 5.4. Then the canonical epimorphism $r: G \rightarrow G^{\text{red}}$ induces an isomorphism $r_*: A_\Sigma(G) \rightarrow A_\Sigma(G^{\text{red}})$.*

Proof. The corollary follows from Corollary 5.6. The second proof can be simplified in this case, using the fact that a Levi decomposition gives a splitting $s: G^{\text{red}} \rightarrow G$ of the epimorphism r . \square

5.8. Let k and Σ be as in 5.4. For the notation $\mathfrak{U}_\Sigma^1(k, T)$, where T is a k -torus, see 0.4. Clearly the functor $T \mapsto \mathfrak{U}_\Sigma^1(k, T)$ satisfies conditions (1–3) of Notation and conventions, so we have functors $G \mapsto \mathfrak{U}_\Sigma^1(k, F_G)$ and $X \mapsto \mathfrak{U}_\Sigma^1(k, S_X)$, as in Sections 1 and 2. We wish to construct an isomorphism of functors $\eta_G: A_\Sigma(G) \xrightarrow{\sim} \mathfrak{U}_\Sigma^1(k, F_G)$.

We start from tori.

Proposition 5.9. *Let k and Σ be as in 5.4, and let T be a k -torus. Let $0 \rightarrow Q \rightarrow P \rightarrow \mathbf{X}_*(T) \rightarrow 0$ be a coflasque resolution of $\mathbf{X}_*(T)$, and let $1 \rightarrow F_T \rightarrow N \rightarrow T \rightarrow 1$ be the corresponding flasque resolution of T (i.e., $\mathbf{X}_*(N) = P$, $\mathbf{X}_*(F_T) = Q$).*

Then the epimorphisms $T(k) \rightarrow H^1(k, F_T)$ and $T(k_v) \rightarrow H^1(k_v, F_T)$ define a canonical isomorphism $\eta_T: A_\Sigma(T) \rightarrow \mathfrak{U}_\Sigma^1(k, F_T)$. This isomorphism is functorial in T .

Proof. See [15, Prop. 18], [12, §3.3]. \square

We now pass to the case of any connected linear algebraic k -group G .

Theorem 5.10. *Let k be a field of type (ll) or (gl). In the case (gl) we assume that G has no factor of type E_8 . Let $\Sigma \subset \Omega$ be a finite set of places of k . Then the isomorphism of functors of Proposition 5.9 can be uniquely extended to an isomorphism of functors $\eta_G: A_\Sigma(G) \rightarrow \mathfrak{U}_\Sigma^1(k, F_G)$ from the category of connected linear k -groups to the category of abelian groups.*

Corollary 5.11. *For k , G , and Σ as in Theorem 5.10, if the image of $\text{Gal}(\bar{k}/k)$ in $\text{Aut } \pi_1(G)$ is a metacyclic group, then $A_\Sigma(G) = 1$.*

Proof. The corollary follows from Theorem 5.10 and Proposition 1.10. \square

Corollary 5.12. *Let k , G , and Σ be as in Theorem 5.10, then:*

- (i) [12, Thm. 4.13(i)] $A_\Sigma(G)$ is finite;
- (ii) $A_\Sigma(G) \simeq \mathfrak{U}_\Sigma^1(k, S_G)$;
- (iii) the abelian group $A_\Sigma(G)$ is a stably k -birational invariant of G .

Proof. By [12, Thm. 3.2] $H^1(k_v, F_G)$ is finite for any $v \in \Omega$, hence $\mathfrak{U}_\Sigma^1(k, F_G)$ is finite. Now the assertion (i) follows from Theorem 5.10. The assertion (ii) follows from Theorem 5.10 and Theorem 3.5. The assertion (iii) follows from (ii) and Proposition 2.14. \square

Corollary 5.13. *Let k , G , and Σ be as in Theorem 5.10. Let $0 \rightarrow L_{-1} \rightarrow L_0 \rightarrow \pi_1(G) \rightarrow 0$ be a torsion-free resolution of $\pi_1(G)$. Let T_{-1} and T_0 be the k -tori such that $\mathbf{X}_*(T_i) = L_i$, $i = -1, 0$. Then $A_\Sigma(G) \simeq \mathfrak{U}_\Sigma^0(k, T_{-1} \rightarrow T_0)$, where*

$$\mathfrak{U}_\Sigma^0(k, T_{-1} \rightarrow T_0) = \text{coker} \left[\mathbb{H}^0(k, T_{-1} \rightarrow T_0) \rightarrow \prod_{v \in \Sigma} \mathbb{H}^0(k_v, T_{-1} \rightarrow T_0) \right],$$

\mathbb{H}^0 denoting the 0-dimensional Galois hypercohomology.

Idea of proof. Note that $\mathfrak{U}_\Sigma^0(k, T_{-1} \rightarrow T_0)$ does not depend on the resolution. We take a coflasque resolution $0 \rightarrow Q \rightarrow P \rightarrow \pi_1(G) \rightarrow 0$ and prove that $\mathfrak{U}_\Sigma^0(k, F_G \rightarrow N) \simeq \mathfrak{U}_\Sigma^1(k, F_G)$, where F_G and N are the k -tori such that $\mathbf{X}_*(F_G) = Q$, $\mathbf{X}_*(N) = P$. \square

We prove Theorem 5.10 in the rest of this section. We use the method of Kottwitz. We need two lemmas.

Lemma 5.14. *Let G be as in Theorem 5.10, and assume that G is reductive and G^{ss} is simply connected. Then the canonical homomorphism $t: G \rightarrow G^{\text{tor}}$ induces an isomorphism $t_*: A_\Sigma(G) \rightarrow A_\Sigma(G^{\text{tor}})$.*

Proof. We give two proofs.

First proof. By [12, Thm. 4.7] $\overline{G^{\text{ss}}(k)} = G^{\text{ss}}(k_\Sigma)$. Since k is of type (gl) or (ll), k_v is of type (sl) for any $v \in \Omega$ (see [12, end of §1]), and by the results of [12, §1] we have $H^1(k, G^{\text{ss}}) = 1$ and $H^1(k_v, G^{\text{ss}}) = 1$ for any v . The lemma now follows from Lemma 5.5.

Second proof. Similar to the second proof of Lemma 4.12, but using [12, Thm. 4.13] instead of Corollary 4.6 ([12, Thm. 4.12]). \square

Lemma 5.15. *Let G be as in Lemma 5.14, then the canonical homomorphism $t: G \rightarrow G^{\text{tor}}$ induces an isomorphism $t_*: \mathfrak{U}_\Sigma^1(k, F_G) \rightarrow \mathfrak{U}_\Sigma^1(k, F_{G^{\text{tor}}})$.*

Proof. This is an immediate consequence of Corollary 3.8. \square

5.16. We can now extend the isomorphism of functors $\eta_G: A_\Sigma(G) \rightarrow \mathfrak{U}_\Sigma^1(k, F_G)$ from the category of k -tori to the category of reductive k -groups G such that G^{ss} is simply connected (and in the case (gl) G has no E_8 -factor). Namely, we must define an isomorphism $\eta_G: A_\Sigma(G) \rightarrow \mathfrak{U}_\Sigma^1(k, F_G)$ so that the following diagram is commutative:

$$\begin{array}{ccc} A_\Sigma(G) & \xrightarrow{\eta_G} & \mathfrak{U}_\Sigma^1(k, F_G) \\ t_* \downarrow & & \downarrow t_* \\ A_\Sigma(G^{\text{tor}}) & \xrightarrow{\eta_{G^{\text{tor}}}} & \mathfrak{U}_\Sigma^1(k, F_{G^{\text{tor}}}) \end{array}$$

By Proposition 5.9, Lemmas 5.14 and 5.15, all the other three arrows in the diagram are isomorphisms. The isomorphism η_G is functorial in G .

5.17. We can now extend η_G to the category of all connected reductive k -groups G such that in the case (gl) G has no factor of type E_8 . Choose a z -extension $H \xrightarrow{\beta} G$. We must define η_G so that the following diagram is commutative:

$$\begin{array}{ccc} A_\Sigma(H) & \xrightarrow{\eta_H} & \mathfrak{U}_\Sigma^1(k, F_H) \\ \beta_* \downarrow & & \downarrow \beta_* \\ A_\Sigma(G) & \xrightarrow{\eta_G} & \mathfrak{U}_\Sigma^1(k, F_G) \end{array}$$

The left vertical arrow is an isomorphism by Corollary 5.6, the right vertical arrow is an isomorphism by Lemma 3.15, and the top horizontal arrow is an isomorphism by 5.16, and η_G is thus defined. Using Lemma 3.16, one can easily check that η_G does not depend on the choice of a z -extension $H \xrightarrow{\beta} G$ and is functorial in G .

5.18. We can now extend η_G to the category of all connected linear algebraic k -groups G such that in the case (gl) G^{red} has no factor of type E_8 . We must define η_G so that the following diagram is commutative:

$$\begin{array}{ccc} A_\Sigma(G) & \xrightarrow{\eta_G} & \mathfrak{U}_\Sigma^1(k, F_G) \\ r_* \downarrow & & \downarrow r_* \\ A_\Sigma(G^{\text{red}}) & \xrightarrow{\eta_{G^{\text{red}}}} & \mathfrak{U}_\Sigma^1(k, F_{G^{\text{red}}}) \end{array}$$

The left vertical arrow is an isomorphism by Corollary 5.7, the right vertical arrow is an isomorphism by Lemma 3.18, and the bottom horizontal arrow is an isomorphism by 5.17, and η_G is thus defined. The isomorphism η_G is functorial in G .

Theorem 5.10 is completely proved.

6. GALOIS COHOMOLOGY

In this section for a connected linear algebraic group G over a field k of one of types (gl), (sl), (ll) we compute $H^1(k, G)$ in terms of $\pi_1(G)$.

6.1. Let k be a field of characteristic 0. Let G be a connected linear k -group. Let

$$0 \rightarrow L_{-1} \rightarrow L_0 \rightarrow \pi_1(G) \rightarrow 0$$

be any (not necessarily coflasque) resolution of $\pi_1(G)$, where L_{-1} and L_0 are finitely generated torsion-free Γ -modules. Let T_{-1}, T_0 be the k -tori such that $\mathbf{X}_*(T_{-1}) = L_{-1}$, $\mathbf{X}_*(T_0) = L_0$. Set $H_{\text{ab}}^n(k, G) = \mathbb{H}^n(k, T_{-1} \rightarrow T_0)$ (hypercohomology) for $n \geq -1$. Then $H_{\text{ab}}^n(k, G)$ does not depend on the choice of a resolution (see [6, 2.6.2]), and it is a functor of G .

In the case when G is a reductive group, there exist abelianization maps

$$\text{ab}^n: H^n(k, G) \rightarrow H_{\text{ab}}^n(k, G) \quad (n = 0, 1)$$

constructed in [6, Sect. 3]. When G is any connected linear k -group, we consider the canonical map $r: G \rightarrow G^{\text{red}}$ and define ab^n as the composed maps

$$\text{ab}^n: H^n(k, G) \xrightarrow{r_*} H^n(k, G^{\text{red}}) \rightarrow H_{\text{ab}}^n(k, G) \quad (n = 0, 1).$$

We wish to prove that the map ab^1 is bijective over certain fields. Since the map $r_*: H^1(k, G) \rightarrow H^1(k, G^{\text{red}})$ is bijective (cf. [39, Lemme 1.13]), we may and shall assume in the rest of this section that G is reductive.

There is a canonical exact sequence

$$H^1(k, G^{\text{sc}}) \rightarrow H^1(k, G) \xrightarrow{\text{ab}^1} H_{\text{ab}}^1(k, G).$$

Moreover we can describe the fibers of the map ab^1 . Let $\psi \in Z^1(k, G)$, and let ξ denote the cohomology class of the cocycle ψ . Then by [6, 3.17(ii)]

$$(6.1) \quad (\text{ab}^1)^{-1}(\text{ab}^1(\xi)) \simeq H_{\text{ab}}^0(k, G) \backslash H^1(k, {}_\psi G^{\text{sc}})$$

where the abelian group $H_{\text{ab}}^0(k, G)$ acts on the set $H^1(k, {}_\psi G^{\text{sc}})$ and ${}_\psi G^{\text{sc}}$ denotes the twisted form of G^{sc} defined by ψ .

Proposition 6.2. *Let G be a connected linear algebraic group over a field k of characteristic 0 such that $H^1(k, {}_\psi G^{\text{sc}}) = 1$ for any twisted form ${}_\psi G^{\text{sc}}$ of G^{sc} . Then the map $\text{ab}^1: H^1(k, G) \rightarrow H_{\text{ab}}^1(k, G)$ is injective.*

Proof. The proposition follows from (6.1). □

We wish to describe the image of the map ab^1 in terms of the second non-abelian Galois cohomology.

6.3. A crossed module of k -groups is a homomorphism of k -groups $\alpha: H \rightarrow G$ together with an action of G on H satisfying certain conditions (see, e.g. [6, Def. 3.2.1]). In [6, Sect. 3] Galois hypercohomology $\mathbb{H}^n(k, H \rightarrow G)$ ($n = 0, 1$) with coefficients in a crossed module was defined (Breen [8] defined hypercohomology with coefficients in a crossed module in a very general setting). A 1-cocycle $(u, \psi) \in Z^1(k, H \rightarrow G)$ is a pair of continuous mappings

$$u: \Gamma \times \Gamma \rightarrow H(\bar{k}), \quad \psi: \Gamma \rightarrow G(\bar{k}),$$

such that

$$\begin{aligned} \psi_{\sigma\tau} &= \alpha(u_{\sigma,\tau}) \cdot \psi_\sigma \cdot {}^\sigma\psi_\tau \\ u_{\sigma,\tau\nu} \cdot \psi_{\sigma\sigma} u_{\tau,\nu} &= u_{\sigma\tau,\nu} \cdot u_{\sigma,\tau} \end{aligned}$$

where $\sigma, \tau, \nu \in \Gamma$. Two cocycles (u, ψ) and (u', ψ') are called cohomologous, if there exist a continuous map $a: \Gamma \rightarrow H(\bar{k})$ and an element $g \in G(\bar{k})$ such that

$$\begin{aligned} \psi'_\sigma &= g^{-1} \cdot \alpha(a_\sigma) \cdot \psi_\sigma \cdot {}^\sigma g \\ u'_{\sigma,\tau} &= g^{-1} (a_{\sigma\tau} \cdot u_{\sigma,\tau} \cdot \psi_{\sigma\sigma} a_\tau^{-1} \cdot a_\sigma^{-1}). \end{aligned}$$

The first Galois hypercohomology set is denoted by $\mathbb{H}^1(k, H \rightarrow G)$. The short exact sequence

$$1 \rightarrow (1 \rightarrow G) \rightarrow (H \rightarrow G) \rightarrow (H \rightarrow 1) \rightarrow 1$$

gives rise to an exact sequence

$$(6.2) \quad H^1(k, H) \rightarrow H^1(k, G) \xrightarrow{\gamma} \mathbb{H}^1(k, H \rightarrow G),$$

cf. [6, 3.4.3(i)].

6.4. Construction. Let $(u, \psi) \in Z^1(k, H \rightarrow G)$. We wish to construct a 2-cohomology class $\Delta(u, \psi)$ with coefficients in \bar{H} . For every $\sigma \in \Gamma$ we define a σ -semialgebraic automorphism of \bar{H}

$$f_\sigma \in \text{SAut } \bar{H}, \quad f_\sigma(h) = \psi_{\sigma\sigma} h \quad \text{for } h \in H.$$

(see [5, 1.1] for the definition of semialgebraic automorphisms). Then

$$\begin{aligned} f_{\sigma\tau} &= \text{int}(u_{\sigma,\tau}) \circ f_\sigma \circ f_\tau \\ u_{\sigma,\tau\nu} \cdot f_\sigma(u_{\tau,\nu}) &= u_{\sigma\tau,\nu} \cdot u_{\sigma,\tau} \end{aligned}$$

Thus (u, f) is a non-abelian 2-cocycle in the sense of [5, 1.5]. Let

$$\kappa_\sigma = f_\sigma \pmod{\text{Aut } \bar{H}} \in \text{SOut } G$$

(see [5, 1.2] for the notation). We obtain a homomorphism $\kappa: \Gamma \rightarrow \text{SOut } \bar{H}$. Then $(u, f) \in Z^2(k, \bar{H}, \kappa)$. Set $\Delta(u, \psi) = \text{Cl}(u, f) \in H^2(k, \bar{H}, \kappa)$, where Cl denotes the cohomology class.

Proposition 6.5. *A hypercohomology class $\text{Cl}(u, \psi) \in \mathbb{H}^1(k, H \rightarrow G)$ comes from $H^1(k, G)$ if and only if $\Delta(u, \psi)$ is a neutral element of $H^2(k, \bar{H}, \kappa)$.*

Proof. If $\text{Cl}(u, \psi)$ comes from $H^1(k, G)$, then there exist $a: \Gamma \rightarrow H(\bar{k})$ and $g \in G(\bar{k})$ such that

$$g^{-1} (a_{\sigma\tau} \cdot u_{\sigma,\tau} \cdot \psi_{\sigma\sigma} a_\tau^{-1} \cdot a_\sigma^{-1}) = 1.$$

Then

$$a_{\sigma\tau} \cdot u_{\sigma,\tau} \cdot f_\sigma(a_\tau)^{-1} \cdot a_\sigma^{-1} = 1,$$

hence $\Delta(u, \psi) = \text{Cl}(u, f)$ is neutral, cf. [5, 1.6, 1.5].

Conversely, if $\Delta(u, \psi) = \text{Cl}(u, f)$ is neutral, then there exists $a: \Gamma \rightarrow H(\bar{k})$ such that

$$a_{\sigma\tau} \cdot u_{\sigma,\tau} \cdot f_\sigma(a_\tau)^{-1} \cdot a_\sigma^{-1} = 1.$$

Then

$$a_{\sigma\tau} \cdot u_{\sigma,\tau} \cdot \psi_{\sigma\sigma} a_\tau^{-1} \cdot a_\sigma^{-1} = 1,$$

hence $\text{Cl}(u, \psi)$ comes from $H^1(k, G)$. □

Proposition 6.6. *Let G be a connected linear algebraic group over a field k of characteristic 0. Assume that for any k -kernel of the form $L = (\bar{G}^{\text{sc}}, \kappa)$ all the elements of $H^2(k, L)$ are neutral. Then the map $\text{ab}^1: H^1(k, G) \rightarrow H_{\text{ab}}^1(k, G)$ is surjective.*

Proof. First we describe the construction of the map ab^1 in [6, Sect. 3]. We assume that G is reductive. Consider the map $\rho: G^{\text{sc}} \rightarrow G$. Let $T \subset G$ be a maximal torus. Set $T^{\text{sc}} = \rho^{-1}(T) \subset G^{\text{sc}}$. Then $H_{\text{ab}}^1(k, G) = \mathbb{H}^1(k, T^{\text{sc}} \rightarrow T)$. The embedding

$$\lambda: (T^{\text{sc}} \rightarrow T) \rightarrow (G^{\text{sc}} \rightarrow G)$$

is a quasi-isomorphism of crossed modules, hence

$$\lambda_*: \mathbb{H}^1(k, T^{\text{sc}} \rightarrow T) \rightarrow \mathbb{H}^1(k, G^{\text{sc}} \rightarrow G)$$

is a bijection, cf. [6, Thm. 3.5.3]. We have a canonical map of (6.2) $\gamma: H^1(k, G) \rightarrow \mathbb{H}^1(k, G^{\text{sc}} \rightarrow G)$. By definition

$$\text{ab}^1 = \lambda_*^{-1} \circ \gamma: H^1(k, G) \rightarrow H_{\text{ab}}^1(k, G).$$

It suffices to prove that γ is surjective. But this follows from Proposition 6.5, because by assumption all the elements of $H^2(k, \bar{G}^{\text{sc}}, \kappa)$ are neutral for any κ . \square

Theorem 6.7. *Let k be a field of one of types (gl), (sl), (ll) and let G be a connected linear k -group. In the case (gl) assume that G has no factors of type E_8 . Then the abelianization map $\text{ab}^1: H^1(k, G) \rightarrow H_{\text{ab}}^1(k, G)$ is bijective.*

Proof. By [12, §1] we have $H^1(k, \psi G^{\text{sc}}) = 1$ for any twisted form ψG^{sc} of G^{sc} , and by [12, Remark after Prop. 5.3] all the elements of $H^2(k, \bar{G}^{\text{sc}}, \kappa)$ are neutral for any κ . The theorem now follows from Propositions 6.2 and 6.6. \square

Remark 6.8. (i) In the case when k is a non-archimedean local field, Theorem 6.7 was proved in [6, Cor. 5.4.1]. The surjectivity of ab^1 was proved by a different method. This result is essentially due to Kottwitz [27, Prop. 6.4]. Note that the method of the present paper also works. The assertion that all the elements of $H^2(k, L)$ are neutral when $L = (\bar{G}, \kappa)$ with \bar{G} semisimple simply connected, was proved in [19, Thm. 1.1], see also [5, Cor. 5.6].

(ii) Theorem 6.7 also holds when k is a totally imaginary number field. The injectivity of ab^1 follows from the Hasse principle for simply connected k -groups (Kneser–Harder–Chernousov). The surjectivity holds for any number field k , see Theorem 8.14 below.

7. HASSE PRINCIPLE

In this section we consider the case where k is a field of type (ll). For a connected linear algebraic k -group G one can define the Tate–Shafarevich kernel

$$\text{III}^1(k, G) = \ker \left[H^1(k, G) \rightarrow \prod_{v \in \Omega} H^1(k_v, G) \right]$$

which is a finite set [12, Thm. 5.1]. Here Ω is the associated set of places, see [12, §1]. We compute $\text{III}^1(k, G)$ in terms of $\pi_1(G)$ and in terms of S_G , and prove that the cardinality of $\text{III}^1(k, G)$ is a stably k -birational invariant of G .

We define $\text{III}_{\text{ab}}^1(k, G) = \ker [H_{\text{ab}}^1(k, G) \rightarrow \prod_{v \in \Omega} H_{\text{ab}}^1(k_v, G)]$.

Theorem 7.1. *Let k be a field of type (ll), and G a connected linear k -group. Then the abelianization map $\text{ab}^1: H^1(k, G) \rightarrow H_{\text{ab}}^1(k, G)$ induces a bijection $\text{III}^1(k, G) \xrightarrow{\sim} \text{III}_{\text{ab}}^1(k, G)$.*

Proof. Since k is of type (ll), k_v is of type (sl) for any $v \in \Omega$. By Theorem 6.7, in the commutative diagram

$$\begin{array}{ccc} H^1(k, G) & \longrightarrow & H_{\text{ab}}^1(k, G) \\ \downarrow & & \downarrow \\ \prod_{v \in \Omega} H^1(k_v, G) & \longrightarrow & \prod_{v \in \Omega} H_{\text{ab}}^1(k_v, G) \end{array}$$

both horizontal arrows are bijections, and our theorem follows. \square

7.2. We now take a *coflasque* resolution

$$0 \rightarrow Q \rightarrow P \rightarrow \pi_1(G) \rightarrow 0$$

where P is a permutation module and Q is a coflasque module. Let F and N be the k -tori such that $\mathbf{X}_*(F) = Q$, $\mathbf{X}_*(N) = P$. The exact sequence of complexes of tori

$$1 \rightarrow (1 \rightarrow N) \rightarrow (F \rightarrow N) \rightarrow (F \rightarrow 1) \rightarrow 1$$

induces an exact sequence

$$(7.1) \quad 0 = H^1(k, N) \rightarrow \mathbb{H}^1(k, F \rightarrow N) \xrightarrow{\Delta} H^2(k, F) \rightarrow H^2(k, N).$$

Clearly we have $\mathbb{H}^1(k, F \rightarrow N) = H_{\text{ab}}^1(k, G)$.

Lemma 7.3. *For any quasi-trivial torus N' over a field k of type (II) we have $\mathbb{H}^2(k, N') = 0$.*

Proof. The lemma follows from [12, Thm. 1.6] ([14, Cor. 1.10]) and Shapiro's lemma. \square

Proposition 7.4. *The map $\Delta: H_{\text{ab}}^1(k, G) \rightarrow H^2(k, F)$ of (7.1) induces an isomorphism $\mathbb{H}_{\text{ab}}^1(k, G) \rightarrow \mathbb{H}^2(k, F)$.*

Proof. We have a commutative diagram with exact rows

$$\begin{array}{ccccccc} 0 & \longrightarrow & H_{\text{ab}}^1(k, G) & \xrightarrow{\Delta} & H^2(k, F) & \longrightarrow & H^2(k, N) \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & \prod_v H_{\text{ab}}^1(k, G) & \longrightarrow & \prod_v H^2(k, F) & \longrightarrow & \prod_v H^2(k, N) \end{array}$$

By Lemma 7.3 $\mathbb{H}^2(k, N) = 0$. Now the proposition can be proved by easy diagram chasing. \square

7.5. Over a field k of type (II) the functor $T \mapsto \mathbb{H}^2(k, T)$ on the category of k -tori satisfies the properties (1–3) of Notation and conventions (by Lemma 7.3), so we have functors $G \mapsto \mathbb{H}^2(k, F_G)$ and $X \mapsto \mathbb{H}^2(k, S_X)$ as in Sections 1 and 2.

Theorem 7.6. *Let G be a connected linear algebraic group over a field k of type (II). Then*

(i) *there exist canonical isomorphisms $\mathbb{H}_{\text{ab}}^1(k, G) \simeq \mathbb{H}^2(k, F_G) \simeq \mathbb{H}^2(k, S_G)$ and a canonical bijection $\mathbb{H}^1(k, G) \simeq \mathbb{H}^2(k, S_G)$;*

(ii) *the group $\mathbb{H}_{\text{ab}}^1(k, G)$ and the set $\mathbb{H}^1(k, G)$ are stably k -birational invariants of a connected linear k -group G .*

Proof. (i) In 7.2 we may write F_G instead of F , then by Proposition 7.4 we have a canonical isomorphism $\mathbb{H}_{\text{ab}}^1(k, G) \simeq \mathbb{H}^2(k, F_G)$. By Theorem 3.5 there exists a canonical isomorphism $\mathbb{H}^2(k, F_G) \simeq \mathbb{H}^2(k, S_G)$. From these isomorphisms and the bijection of Theorem 7.1 we obtain a canonical bijection $\mathbb{H}^1(k, G) \simeq \mathbb{H}^2(k, S_G)$.

(ii) The assertion follows from (i) and Proposition 2.14. \square

Corollary 7.7. *If G is a stably k -rational group, then $\mathbb{H}^1(k, G) = 1$.* \square

Corollary 7.8. *If the image of $\text{Gal}(\bar{k}/k)$ in $\text{Aut } \pi_1(G)$ is metacyclic, then $\mathbb{H}^1(k, G) = 1$.* \square

Theorem 7.9. *Let k be a field of type (II), G a connected linear k -group. If there exists a k -variety X such that $G \times X$ is k -rational, then $\mathbb{H}^1(k, G) = 1$.*

Proof. Assume that $G \times X$ is k -rational. We argue as in [12, Proof of Thm. 5.2]. By [17, Prop. 2.A.1, p. 461] there exists a Γ -module M such that $\text{Pic } \bar{V}_G \oplus M$ is a permutation module. Let T be the torus such that $\mathbf{X}^*(T) = M$, then we obtain that $S_G \times T$ is a quasi-trivial torus. By Lemma 7.3 we have $\mathbb{H}^2(k, S_G) \times \mathbb{H}^2(k, T) = 0$, whence $\mathbb{H}^2(k, S_G) = 0$. By Theorem 7.6(i) $\mathbb{H}^1(k, G) = 1$. \square

Remark 7.10. (i) Theorem 7.9 generalizes [12, Thm. 5.2(b)(ii)].

(ii) Corollary 7.7 proves a conjecture of [12, Remark (i) after Thm. 5.2].

(iii) The canonical bijection $\text{III}^1(k, G) \rightarrow \text{III}_{\text{ab}}^1(k, G)$ of Theorem 7.1 defines a canonical and functorial structure of an abelian group on $\text{III}^1(k, G)$, and this abelian group is a stably k -birational invariant of G .

(iv) The results of this section also hold when k is a totally imaginary number field.

8. CASE OF A NUMBER FIELD

All the results of Sections 4–7 hold when k is a totally imaginary number field. In this section we suppose that k is *any* number field, not necessarily totally imaginary. We prove analogues of the results of Sections 4, 5, 7.

We start from R -equivalence.

Proposition 8.1. *Let G be a semisimple simply connected group over a number field k . Assume that G has no anisotropic factors of type E_6 . Then $G(k)/R = 1$.*

Proof. First assume that G is isotropic. Let S be a maximal split torus of G , and $Z_G(S)$ the centralizer of S in G . Then $Z_G(S)$ is connected reductive, and $Z_G(S)^{\text{ss}}$ is a k -anisotropic simply connected semisimple group. By the Appendix by P. Gille, Corollary, the map $Z_G(S)^{\text{ss}}(k)/R \rightarrow G(k)/R$ is surjective. This reduces the proposition to the case of an anisotropic group.

The anisotropic groups were treated, case by case, by many people, see [10] and [38, Ch. 9]. A difficult case of ${}^{3,6}D_4$ was treated in [10]. \square

Proposition 8.2. *Let G be a connected reductive group over a number field k without anisotropic factors of type E_6 . Assume that G admits a special covering*

$$1 \rightarrow \mu \rightarrow G_0 \times N_0 \rightarrow G \rightarrow 1$$

where G_0 is simply connected and N_0 is a quasi-trivial torus. Let

$$1 \rightarrow \mu \rightarrow F \rightarrow N \rightarrow 1$$

be a flasque resolution of μ . Then Galois cohomology exact sequences induce an isomorphism of groups $G(k)/R \simeq H^1(k, F)$.

Proof. By [21, Thm. III.3.1] Galois cohomology exact sequences induce an exact sequence

$$G_0(k)/R \times N_0(k)/R \rightarrow G(k)/R \rightarrow H^1(k, F) \rightarrow 1.$$

We have $N_0(k)/R = 1$ because N_0 is k -rational, and $G_0(k)/R = 1$ by Proposition 8.1. Thus we obtain an isomorphism $G(k)/R \simeq H^1(k, F)$. \square

Lemma 8.3. *Let G be a connected reductive group over a number field k without anisotropic factors of type E_6 . Assume that G^{ss} is simply connected. Then the canonical map $t: G \rightarrow G^{\text{tor}}$ induces an isomorphism $t_*: G(k)/R \rightarrow G^{\text{tor}}(k)/R$.*

Proof. First proof. The lemma follows from Theorem 1(a) of the Appendix by P. Gille, and Proposition 8.1.

Second proof. Similar to the second proof of Lemma 4.12. Instead of Corollary 4.6 of Theorem 4.5 we use Proposition 8.2. \square

Theorem 8.4. *Let k be a number field, and consider the category of connected linear k -groups G such that G has no anisotropic factors of type E_6 . Then the isomorphism of functors δ_{T^*} of Theorem 4.3 extends uniquely to an isomorphism of functors $\theta_G: G(k)/R \rightarrow H^1(k, F_G)$.*

Proof. Similar to that of Theorem 4.8. \square

Corollary 8.5. *Let k and G be as in Theorem 8.4. Then*

(i) *there is a canonical isomorphism $G(k)/R \simeq H^1(k, S_G)$;*

(ii) *the group $G(k)/R$ is a stably k -birational invariant of G .* \square

8.6. We pass to weak approximation over a number field k . Let Ω be the set of all places of k . We write Ω_∞ (resp. Ω_f) for the set of all infinite (resp. finite) places of k .

Lemma 8.7. (stated in [39, Prop. 3.3]) *Let G be a connected linear algebraic group over a number field k . Let Σ be a finite set of places of k . Then the canonical epimorphism $r: G \rightarrow G^{\text{red}}$ induces an isomorphism $r_*: A_\Sigma(G) \rightarrow A_\Sigma(G^{\text{red}})$.*

Proof. Similar to that of Corollary 5.7, second proof. \square

Lemma 8.8. *Let G and k be as in Lemma 8.7, and let $\Sigma' \supset \Sigma$, where $\Sigma' - \Sigma \subset \Omega_\infty$. Then the projection $G(k_{\Sigma'}) \rightarrow G(k_\Sigma)$ induces an isomorphism $A_{\Sigma'}(G) \rightarrow A_\Sigma(G)$.*

Proof. The lemma follows from results of Sansuc [39]. Indeed, by Lemma 8.7 we may assume that G is reductive. By [39, Lemme 1.10] we may assume that G admits a special covering

$$1 \rightarrow \mu \rightarrow G_0 \times N_0 \rightarrow G \rightarrow 1$$

where G_0 is a simply connected group and N_0 is a quasi-trivial torus. By [39, (3.3.1)] there is a canonical and functorial in Σ isomorphism $A_\Sigma(G) \rightarrow \mathcal{U}_\Sigma^1(k, \mu)$. By [39, formula after Lemma 1.5], the canonical map $\mathcal{U}_{\Sigma'}^1(k, \mu) \rightarrow \mathcal{U}_\Sigma^1(k, \mu)$ is an isomorphism. Hence the map $A_{\Sigma'}(G) \rightarrow A_\Sigma(G)$ is an isomorphism. \square

Lemma 8.9. *Let*

$$1 \rightarrow G_1 \rightarrow G_2 \xrightarrow{\beta} G_3 \rightarrow 1$$

be an exact sequence of connected linear algebraic groups over a number field k . Assume that $H^1(k_v, G_1) = 1$ for all $v \in \Omega_f$ and that $\text{III}^1(k, G_1) = 1$. Let $\Sigma \subset \Omega$ be a finite set. Assume that $A_\Sigma(G_1) = 1$. Then the map $\beta_: A_\Sigma(G_2) \rightarrow A_\Sigma(G_3)$ is an isomorphism.*

Proof. We prove that β_* is surjective. By Lemma 8.8 we may assume that $\Sigma \subset \Omega_f$. Then $H^1(k_v, G_1) = 1$ for all $v \in \Sigma$, hence the map $\beta: G_2(k_\Sigma) \rightarrow G_3(k_\Sigma)$ is surjective, thus β_* is surjective.

We prove that β_* is injective. We use an idea of [36, Proof of Lemma 3.8]. By Lemma 8.8 we may assume that $\Sigma \supset \Omega_\infty$.

First we prove that $\beta(G_2(k_\Sigma)) \cap \overline{G_3(k)} \subset \beta(\overline{G_2(k)})$. Let $g_{2\Sigma} \in G_2(k_\Sigma)$ and assume that $\beta(g_{2\Sigma}) \in \overline{G_3(k)}$. By Lemma 5.2 the subgroup $\overline{G_2(k)}$ is open in $G_2(k_\Sigma)$, and the map $\beta: G_2(k_\Sigma) \rightarrow G_3(k_\Sigma)$ is open, hence the group $U_3 := \beta(\overline{G_2(k)})$ is open in $G_3(k_\Sigma)$. The open set $\beta(g_{2\Sigma})U_3$ is an open neighborhood of $\beta(g_{2\Sigma})$. Since $\beta(g_{2\Sigma}) \in \overline{G_3(k)}$, there exists $g_{3k} \in \beta(g_{2\Sigma})U_3 \cap G_3(k)$. Then $g_{3k} = \beta(g_{2\Sigma})\beta(\bar{g}_2)$, where $\bar{g}_2 \in \overline{G_2(k)}$. Thus $g_{3k} = \beta(g_{2\Sigma}\bar{g}_2)$ where $g_{2\Sigma}\bar{g}_2 \in G_2(k_\Sigma)$. Since $\Sigma \supset \Omega_\infty$, we see that g_{3k} lifts to $G_2(k_v)$ for every $v \in \Omega_\infty$, and by assumptions g_{3k} lifts to $G_2(k)$. Thus $g_{3k} = \beta(g_{2k})$ for some $g_{2k} \in G_2(k)$. We obtain that $\beta(g_{2\Sigma}) = \beta(g_{2k}\bar{g}_2^{-1})$ where $g_{2k}\bar{g}_2^{-1} \in G_2(k)\overline{G_2(k)} = \overline{G_2(k)}$. Thus $\beta(g_{2\Sigma}) \in \beta(\overline{G_2(k)})$, which was to be proved.

Then we prove that $\beta^{-1}(\overline{G_3(k)}) \subset \overline{G_2(k)}$. The proof is similar to the argument in the proof of Lemma 5.5 (we use the assumption that $A_\Sigma(G_1) = 1$). From the inclusion $\beta^{-1}(\overline{G_3(k)}) \subset \overline{G_2(k)}$ it follows immediately that the map $\beta_*: A_\Sigma(G_2) \rightarrow A_\Sigma(G_3)$ is injective. Thus β_* is bijective. \square

Corollary 8.10. *Let*

$$1 \rightarrow G_1 \rightarrow G_2 \xrightarrow{\beta} G_3 \rightarrow 1$$

be an exact sequence of connected linear algebraic groups over a number field k . Let $\Sigma \subset \Omega$ be a finite set. Assume that G_1 is a quasi-trivial k -torus or a unipotent group. Then the map $\beta_: A_\Sigma(G_2) \rightarrow A_\Sigma(G_3)$ is an isomorphism.*

Proof. The corollary follows from Lemma 8.9. For another proof see Corollary 5.6, second proof. \square

Theorem 8.11. *Let k be a number field, $\Sigma \subset \Omega$ a finite set of places. Then the isomorphism of functors $\eta_T: A_\Sigma(T) \rightarrow \mathfrak{U}_\Sigma^1(k, F_T)$ of Proposition 5.9 can be uniquely extended to an isomorphism of functors $\eta_G: A_\Sigma(G) \rightarrow \mathfrak{U}_\Sigma^1(k, F_G)$ from the category of connected linear k -groups to the category of abelian groups.*

Proof. Similar to that of Theorem 5.10. We use Lemma 8.9, Corollary 8.10, and Lemma 8.7. \square

Corollary 8.12. *Let k , Σ , and G be as in Theorem 8.11. Then:*

- (i) $A_\Sigma(G) \simeq \mathfrak{U}_\Sigma^1(k, S_G)$;
- (ii) ([37, Thm. 2.1(3)]) *the abelian group $A_\Sigma(G)$ is a stably k -birational invariant of G ;*
- (iii) $A_\Sigma(G) \simeq \mathfrak{U}_\Sigma^0(k, T_{-1} \rightarrow T_0)$ with the notation of Corollary 5.13. \square

Remark 8.13. In the proof of Theorem 8.11 we actually proved that $A_\Sigma(G) = A_\Sigma(T)$, where $T = H^{\text{tor}}$ and H is a z -extension of G^{red} . This result was earlier proved in [36, Lemma 3.8].

Now we pass to Galois cohomology and Hasse principle.

Theorem 8.14. *Let G be a connected linear algebraic group over a number field k . Then the map $\text{ab}^1: H^1(k, G) \rightarrow H_{\text{ab}}^1(k, G)$ is surjective.*

Proof. By [39, Lemme 1.13] the map $r_*: H^1(k, G) \rightarrow H^1(k, G^{\text{red}})$ is bijective, hence we may assume that G is reductive. In this case the assertion was proved in [6, Thm. 5.7]. We give here another proof (assuming that G is reductive). By Douai's theorem [20, Thm. 5.1], see also [5, Cor. 5.6], for any k -kernel of the type $L = (\bar{G}^{\text{sc}}, \kappa)$, all the elements of $H^2(k, L)$ are neutral. By Proposition 6.6 the map ab^1 is surjective. \square

Note that over a number field the map ab^1 can be non-injective.

We define $\text{III}_{\text{ab}}^1(k, G)$ as in Section 7.

Theorem 8.15. [6, Thm. 5.13] *Let G be a connected linear algebraic group over a number field k . Then the map $\text{ab}^1: H^1(k, G) \rightarrow H_{\text{ab}}^1(k, G)$ induces a bijection $\text{III}^1(k, G) \rightarrow \text{III}_{\text{ab}}^1(k, G)$.*

When k is a number field, we have $\text{III}^2(k, N) = 0$ for any quasi-trivial k -torus N . Hence the functor $\mathcal{H}(T) = \text{III}^2(k, T)$ satisfies conditions (1–3) of Notation and conventions. It follows that we can define functors $\text{III}^2(k, F_G)$ and $\text{III}^2(k, S_X)$ as in Sections 1 and 2.

Theorem 8.16. *Let G be a connected linear algebraic group over a number field k . Then*

- (i) *there exist canonical isomorphisms $\text{III}_{\text{ab}}^1(k, G) \simeq \text{III}^2(k, F_G) \simeq \text{III}^2(k, S_G)$ and a canonical bijection $\text{III}^1(k, G) \simeq \text{III}^2(k, S_G)$;*
- (ii) *the group $\text{III}_{\text{ab}}^1(k, G)$ and the set $\text{III}^1(k, G)$ are stably k -birational invariants of a connected linear k -group G .*

Proof. Similar to that of Theorem 7.6. \square

Remark 8.17. (i) The set $\text{III}^1(k, G)$ over a number field k was computed in terms of $\pi_1(G)$ in [27, 4.2].

(ii) Sansuc [39, (9.5.1)] proved by a different method that there exists a bijection $\text{III}^1(k, G) \simeq \text{III}^2(k, S_G)$, and he deduced that the set $\text{III}^1(k, G)$ is a stably k -birational invariant of G .

Corollary 8.18. *Let G be a connected linear algebraic group over a number field k . If the image of $\text{Gal}(\bar{k}/k)$ in $\text{Aut } \pi_1(G)$ is metacyclic, then $G(k)/R = 1$, $A_\Sigma(G) = 1$ for any finite Σ , and $\text{III}^1(k, G) = 1$.*

Proof. We use Proposition 1.10. \square

Appendix

Philippe Gille

In the papers [21], [22] we passed from semisimple groups to reductive groups using Sansuc's special isogenies. Some results can be formulated and proved in the setting of this paper, which roughly speaking replaces isogenies by morphisms $G \rightarrow T$ from reductive groups to tori and uses z -extensions. We give here other formulations of Theorem III.3.1 of [21], Theorem 6 of [22] and Theorem 4.12 of [12] on R -equivalence.

Let k be a field. Let F be a covariant functor from commutative k -algebras to sets. Let O denote the semilocal ring of the polynomial algebra $k[t]$ at the points $t = 0$ and $t = 1$. Let us say that two elements $a, b \in F(k)$ are elementarily related if there exists $\xi \in F(O)$ such that $\xi(0) = a$ and $\xi(1) = b$. By definition, R -equivalence on $F(k)$ is the equivalence relation generated by the previous elementary relation. Thus two elements $a, b \in F(k)$ are R -equivalent if and only if there exists a finite set of elements $x_0, \dots, x_{n+1} \in F(k)$, with $x_0 = a$ and $x_{n+1} = b$, such that x_i is elementarily related to x_{i+1} for $0 \leq i \leq n$. We let $F(k)/R$ denote the quotient set for this equivalence relation. For any field K containing k , we define a similar equivalence relation on $F(K)$ by using the semilocal ring of $K[t]$ at the points $t = 0$ and $t = 1$. There is a natural, functorial map $F(k)/R \rightarrow F(K)/R$. If F goes from commutative k -algebras to groups, the class of R -equivalence of e , denoted by $RF(k)$, is a normal subgroup of $F(k)$, and $F(k)/R = F(k)/RF(k)$; any element of $RF(k)$ is elementarily related to 1 (cf. [21], Lemme II.1.1). If $F = F_X$ is the functor associated to a k -variety X , namely $F_X(A) = X(A)$, we get the R -equivalence on $X(k)$, as defined by Manin.

Lemma 1 (see [21], Proposition II.1.3) *Let $1 \rightarrow \tilde{G} \xrightarrow{i} G \xrightarrow{\lambda} T \rightarrow 1$ be an exact sequence of reductive k -groups where T/k is a k -torus. We denote by C_λ the functor $A \mapsto \lambda(G(A)) \subset T(A)$ from commutative k -algebras to groups. Then $\lambda(RG(k)) = RC_\lambda(k)$ and we have a natural exact sequence of groups*

$$\tilde{G}(k)/R \rightarrow G(k)/R \rightarrow C_\lambda(k)/R \rightarrow 1.$$

Proof : We have to prove that $RC_\lambda(k) \subset \lambda(RG(k))$. Let $c \in RC_\lambda(k)$. Then there exists $c \in C_\lambda(O)$ such that $c(0) = 1$ and $c(1) = c$. By definition, there exists $g \in G(O)$ such that $\lambda(g) = c$. The sequence of groups $\tilde{G}(k) \xrightarrow{i} G(k) \rightarrow T(k)$ is exact; so there exists $\tilde{g}_0 \in \tilde{G}(k)$ such that $i(\tilde{g}_0) = g(0)$. We set $g' := gi(\tilde{g}_0)^{-1} \in G(O)$. Then $g'(0) = 1$, so $g'(1) \in RG(k)$ and $\lambda(g'(1)) = \lambda(g)(1) = c(1) = c$ and $c \in \lambda(RG(k))$.

Theorem 1 *Let k be a field of one of the following types :*

- i) k is a number field,*
- ii) $\text{char}(k) = 0$ and $\text{cd}(k) \leq 2$.*

Let $1 \rightarrow \tilde{G} \rightarrow G \xrightarrow{\lambda} T \rightarrow 1$ be an exact sequence of reductive k -groups where \tilde{G}/k is semisimple and simply connected and T/k is a k -torus. In case ii), we assume that Serre's Conjecture II holds for \tilde{G}/k , i.e. $H^1(k, \tilde{G}) = 1$.

- a) There is a natural exact sequence of groups*

$$\tilde{G}(k)/R \longrightarrow G(k)/R \longrightarrow T(k)/R \rightarrow 1.$$

b) If moreover k is a field as in 0.1 and \tilde{G} has no E_8 -factor in the case (gl), then there is a natural isomorphism $G(k)/R \xrightarrow{\sim} T(k)/R$.

We recall (cf. [44], §10) that a torus S/\mathbf{R} over the field of real numbers is isomorphic to a product $S = \mathbf{G}_m^r \times R_{\mathbf{C}/\mathbf{R}}(\mathbf{G}_m)^s \times R_{\mathbf{C}/\mathbf{R}}^1(\mathbf{G}_m)^t$, so $S(\mathbf{R}) = (\mathbf{R}^\times)^r \times (\mathbf{C}^\times)^s \times (S^1)^t$ and we denote by $S(\mathbf{R})_+ := (\mathbf{R}_+^\times)^r \times (\mathbf{C}^\times)^s \times (S^1)^t$ the connected component of $S(\mathbf{R})$. If S/k is a torus defined over a number field k , we denote by $S(k)_+$ the preimage of $\prod_{v \text{ real}} S(k_v)_+$ by the diagonal map $S(k) \rightarrow \prod_{v \text{ real}} S(k_v)$, where the product is taken over the real places of k .

Lemma 2 *Assume that k is a number field. Let $1 \rightarrow S \rightarrow E \xrightarrow{f} T \rightarrow 1$ be a flasque resolution of T (where S is a flasque torus and E is a quasi-trivial torus).*

- a) *The group $RT(k)$ is dense in $\prod_{v \text{ real}} T(k_v)$ and we have $T(k) = T(k)_+.RT(k)$ and $T(k)_+ \cap RT(k) = f(E(k)_+)$.*
- b) *The group $RG(k)$ is dense in $\prod_{v \text{ real}} G(k_v)$.*
- c) *$T(k_v)_+ \subset C_\lambda(k_v) \subset T(k_v)$ for any real place v of k .*
- d) *$T(k)_+ \subset \text{Im}(G(k) \xrightarrow{\lambda} T(k))$.*

Proof. a) As R -equivalence is the trivial relation over \mathbf{R} (cf. [21], §III.2.c p. 218) we have the following commutative diagram

$$\begin{array}{ccccccc} S(k) & \longrightarrow & E(k) & \xrightarrow{f_k} & T(k) & \longrightarrow & H^1(k, S) \\ \downarrow & & \downarrow & & \downarrow & & \\ \prod_{v \text{ real}} S(k_v) & \longrightarrow & \prod_{v \text{ real}} E(k_v) & \longrightarrow & \prod_{v \text{ real}} T(k_v) & \longrightarrow & 1. \end{array}$$

The group $E(k)$ is dense in $\prod_{v \text{ real}} E(k_v)$, so the group $RT(k)$ is dense in $\prod_{v \text{ real}} T(k_v)$. For any real place v of k , the map $E(k_v)_+ \rightarrow T(k_v)_+$ is surjective, and a diagram chase gives $f(E(k)).T(k)_+ = T(k)$, so $RT(k).T(k)_+ = T(k)$. We have to prove that $RT(k) \cap T(k)_+ \subset f(E(k)_+)$. Let $t \in RT(k) \cap T(k)_+$. Then there exists $e \in E(k)$ such that $f(e) = t$. There exists $e_v \in E(k_v)_+$ such that $f(e_v) = t \in T(k_v)$ and $s_v := ee_v^{-1} \in S(k_v)$. The weak approximation holds for S at the real places ([39], Lemme 1.8 p. 19), so there exists $s \in S(k)$ such that $ss_v^{-1} \in S(k_v)_+$. Then $f(es^{-1}) = t$ and $es^{-1} \in E(k)_+$.

b) We have to show that any element $(g_v) \in \prod_{v \text{ real}} G(k_v)$ can be approximated by elements of $RG(k)$. As $RG(k)$ is a Zariski-dense subgroup of G , we can assume that some g_v is semisimple regular. Let \mathcal{U} be an open neighborhood of (g_v) . The group G/k satisfies weak approximation at real places ([39], Corollaire 3.5.c p. 26) so there exists $g \in G(k)$ such that $g \in \mathcal{U}$ and we may assume that g is semisimple regular. We consider the maximal torus $Z_G(g)$ of G . By the statement a), the group $RZ_G(g)(k)$ is dense in the closed subgroup $\prod_{v \text{ real}} Z_G(g)(k_v)$ of $\prod_{v \text{ real}} G(k_v)$, so $\mathcal{U} \cap RZ_G(g)(k) \neq \emptyset$ and *a fortiori* $\mathcal{U} \cap RG(k) \neq \emptyset$.

c) We consider the exact sequence of pointed sets

$$G(k_v) \xrightarrow{\lambda_{k_v}} T(k_v) \xrightarrow{\delta_v} H^1(k_v, \tilde{G}).$$

The boundary map $\delta_v : T(k_v) \rightarrow H^1(k_v, \tilde{G})$ is continuous for the real topology, and $H^1(k_v, \tilde{G})$ is finite, so δ_v is trivial on $T(k_v)_+$ and $T(k_v)_+ \subset \lambda(G(k_v)) = C_\lambda(k_v)$.

d) We use now the Hasse principle (Kneser–Harder–Chernousov) for the simply connected group \tilde{G} and we consider the following exact commutative diagram of pointed sets

$$\begin{array}{ccccccc} G(k) & \xrightarrow{\lambda_k} & T(k) & \xrightarrow{\delta} & H^1(k, \tilde{G}) & & \\ \downarrow & & \downarrow & & \downarrow \wr & & \\ \prod_{v \text{ real}} G(k_v) & \longrightarrow & \prod_{v \text{ real}} T(k_v) & \xrightarrow{\delta_v} & \prod_{v \text{ real}} H^1(k_v, \tilde{G}). & & \end{array}$$

By assertion c), the maps δ_v 's are trivial on $T(k_v)_+$ and a diagram chase shows that δ is trivial on $T(k)_+$, i.e. $T(k)_+ \subset \text{Im}(G(k) \xrightarrow{\lambda} T(k))$.

Proof of Theorem 1. a) First step : \tilde{G} is quasi-split: Then \tilde{G} contains a quasi-trivial maximal k -torus E . We consider the maximal k -torus $Z_G(E)$ of G , and we have the following exact sequence of k -tori

$$1 \rightarrow E \rightarrow Z_G(E) \rightarrow T \rightarrow 1.$$

By Hilbert 90 Theorem we have $H^1(k, E) = 0$, so the map $Z_G(E)(k) \rightarrow T(k)$ is surjective and *a fortiori* the map $G(k) \rightarrow T(k)$ is surjective. Moreover, since E is quasi-trivial, by Lemma 4.15 of this paper we have an isomorphism

$$Z_G(E)(k)/R \xrightarrow{\sim} T(k)/R.$$

But according to Proposition 14(i) of [15] on quasi-split groups, we have $Z_G(E)(k)/R \xrightarrow{\sim} G(k)/R$, and we conclude that the map $G(k)/R \rightarrow T(k)/R$ is an isomorphism.

Second step : the general case: We do first the case of number fields i) and shall explain after, how the proof works also for fields of kind ii). Let $RG(k)$ denote the R -equivalence class of 1 in $G(k)$. We denote by $C_\lambda(k) \subset T(k)$ (resp. $RC_\lambda(k) \subset T(k)$) the image by λ of $G(k)$ (resp. $RG(k)$). Let $1 \rightarrow S \rightarrow E \rightarrow T \rightarrow 1$ be a flasque resolution of T (where S is a flasque torus and E is a quasi-trivial torus) and let us consider the map $f : E(k) \rightarrow T(k)$. We begin with the following

Lemma 3 $f(E(k)_+) \subset \text{Im}(RG(k) \xrightarrow{\lambda^*} RT(k))$.

Proof of Lemma 3. The torus E is quasi-trivial, hence we have $E = \prod_{i=1, \dots, r} R_{k_i/k}(\mathbf{G}_m) = \prod_i E_i$ where the k_i/k 's are finite field extensions. We denote by $h_i : E_i \rightarrow E$ the morphism defined by $h_i(e_i) = (1, \dots, 1, e_i, 1, \dots, 1)$. As $E(k)_+ = \prod_i E_i(k)_+$, it is enough to prove that $f(h_i(E_i(k)_+)) \subset \text{Im}(RG(k) \xrightarrow{\lambda^*} RT(k))$ for $i = 1, \dots, r$. We firstly recall the norm principle, i.e. Theorem 3.9 of [32], applied to the extension $1 \rightarrow \tilde{G} \rightarrow G \xrightarrow{\lambda} T \rightarrow 1$. It states that for any finite field extension L/k the norm map $N_{L/k} : T(L) \rightarrow T(k)$ preserves the image by λ of $RG(L)$, i.e. $N_{L/k}(\lambda(RG(L))) \subset \lambda(RG(k)) \subset T(k)$. In other words, we have

$$(*) \quad N_{L/k}(RC_\lambda(L)) \subset RC_\lambda(k) \subset T(k).$$

First case: $k_i = k$ and $E_i = \mathbf{G}_m$. Let L/k be a finite field extension such that G_L is quasi-split, i.e. L satisfies $X(L) \neq \emptyset$, where X denotes the variety of the Borel subgroups of G . By the first step, we have $\lambda(RG(L)) = RT(L) = f(E(L))$, so $RC_\lambda(L) = RT(L) = f(E(L))$. By the norm principle, we get

$$N_{L/k}(f(E(L))) \subset RC_\lambda(k) \subset RT(k).$$

The restriction to the factor E_i yields

$$f(h_i(N_{L/k}(L^\times))) = N_{L/k}(f(h_i(E_i(L)))) \subset RC_\lambda(k).$$

By taking all the finite extensions L such that $X(L) \neq \emptyset$, we get

$$f(h_i(N_X(k))) \subset RC_\lambda(k) \subset RT(k),$$

where $N_X(k)$ denotes the normgroup of X , i.e. the subgroup of k^\times generated by the $N_{L/k}(L^\times)$ for L/k finite satisfying $X(L) \neq \emptyset$. We use now the Hasse principle of Kato-Saito [25, Th. 4] for the normgroup of X

$$k^\times / N_X(k) \xrightarrow{\sim} \bigoplus_{v \in \Omega} k_v^\times / N_X(k_v),$$

where Ω denotes the set of places of k . For a finite place v of k , one has $N_X(k_v) = k_v^\times$ [21, Lemme III.2.8], so $k_v^\times \subset N_X(k)$. We conclude that

$$f(h_i(k_v^\times)) \subset RC_\lambda(k).$$

2-nd case: $E_i = R_{k_i/k} \mathbf{G}_m$. There exists an étale algebra A_i/k_i such that $E_i \otimes_k k_i = \mathbf{G}_{m, k_i} \times R_{A_i/k_i} \mathbf{G}_m$. We consider the following commutative diagram of corestrictions

$$\begin{array}{ccc} E_i(k_i) = k_i^\times \times A_i^\times & \xrightarrow{f_{k_i} \circ h_i} & T(k_i) \\ N_{k_i/k} \downarrow & & N_{k_i/k} \downarrow \\ E_i(k) = k_i^\times & \xrightarrow{f_k \circ h_i} & T(k_i). \end{array}$$

The first case applied to k_i and \mathbf{G}_{m, k_i} gives

$$f_{k_i}(h_i(k_{i,+}^\times \times 1)) \subset RC_\lambda(k_i).$$

The norm principle (i.e. identity (*) above) applied to the extension k_i/k yields

$$N_{k_i/k}(RC_\lambda(k_i)) \subset RC_\lambda(k),$$

so

$$N_{k_i/k}((f_{k_i} \circ h_i)(k_{i,+}^\times \times 1)) \subset RC_\lambda(k).$$

But the norm $N_{k_i/k} : E_i(k_i) \rightarrow E_i(k)$ induces the identity on the first factor k_i^\times , so

$$(f_{k_i} \circ h_i)(E_i(k)_+) \subset RC_\lambda(k),$$

which completes the proof of the lemma.

By Lemma 1, we have an exact sequence

$$\tilde{G}(k)/R \longrightarrow G(k)/R \longrightarrow C_\lambda(k)/RC_\lambda(k) \rightarrow 1.$$

So it remains to prove that the map $C_\lambda(k)/RC_\lambda(k) \rightarrow T(k)/R$ is an isomorphism.

Surjectivity : We have to check that $T(k) = RT(k).C_\lambda(k)$. According to Lemma 2.d, one has $T(k)_+ \subset C_\lambda(k)$, so

$$RT(k).T(k)_+ \subset RT(k).C_\lambda(k).$$

By Lemma 2.a, we have $RT(k).T(k)_+ = T(k)$, so $T(k) = RT(k).C_\lambda(k)$.

Injectivity : We have to check that $RC_\lambda(k) = C_\lambda(k) \cap RT(k)$. The inclusion $RC_\lambda(k) \subset C_\lambda(k) \cap RT(k)$ is obvious, let us show the converse by taking $t \in C_\lambda(k) \cap RT(k)$. By Lemma 2.c, we have the inclusions

$$\prod_{v \text{ real}} T(k_v)_+ \subset \prod_{v \text{ real}} C_\lambda(k_v) \subset \prod_{v \text{ real}} T(k_v),$$

and the group $\prod_{v \text{ real}} T(k_v)_+$ is open in $\prod_{v \text{ real}} C_\lambda(k_v)$. By Lemma 2.b, the group $RC_\lambda(k)$ is a dense subgroup of $\prod_{v \text{ real}} C_\lambda(k_v)$, so there exists $t_0 \in RC_\lambda(k)$ such that $tt_0^{-1} \in T(k)_+ = T(k) \cap \bigcap_{v \text{ real}} T(k_v)_+$. By Lemma 2.a and Lemma 3, one has

$$RT(k) \cap T(k)_+ = f(E(k)_+) \subset RC_\lambda(k),$$

so $tt_0^{-1} \in RC_\lambda(k)$ and finally $t = (tt_0^{-1})t_0 \in RC_\lambda(k)$. We conclude that $C_\lambda(k) \cap RT(k) = RC_\lambda(k)$ as desired.

The case of a field of type ii) is much simpler and one replaces the Hasse principle of Kato-Saito by the fact that $N_X(k) = k^\times$ ([22], Th. 6.a). In that case, Lemma 3 yields $RT(k) = RC_\lambda(k)$. Moreover, the assumption on the vanishing of $H^1(k, \tilde{G})$ implies that the map $G(k) \rightarrow T(k)$ is surjective. So $C_\lambda(k)/RC_\lambda(k) = T(k)/RT(k)$ and the exact sequence (Lemma 1)

$$\tilde{G}(k)/R \longrightarrow G(k)/R \longrightarrow C_\lambda(k)/RC_\lambda(k) \rightarrow 1,$$

induces the exact sequence

$$\tilde{G}(k)/R \longrightarrow G(k)/R \longrightarrow T(k)/R \rightarrow 1$$

as desired.

b) If k is as in 0.1, Serre's Conjecture II holds by Theorems 1.3, 1.4 and 1.5 of [12] and the group \tilde{G} satisfies $\tilde{G}(k)/R = 1$ (*ibid.*, Corollary 4.6). In this case we deduce that the map $G(k)/R \rightarrow T(k)/R$ is an isomorphism.

Corollary *Let k be a field as in Theorem 1. Let G be a semisimple simply connected group and $S \subset G$ be a k -split torus of G . Then the group $Z_G(S)^{\text{ss}}$ is semisimple and simply connected and the natural map*

$$Z_G(S)^{\text{ss}}(k)/R \rightarrow G(k)/R$$

is surjective.

Proof: According to Theorem 4.15.a of [3], the centralizer $Z_G(S)$ is the Levi subgroup of some k -parabolic subgroup P of G . The fact that $Z_G(S)^{\text{ss}}/k$ is simply connected is well-known, it can be deduced from the presentation of standard parabolic subgroups [BT1, §4] and Corollary 4.4 of [4]. We denote by U the unipotent radical of P and we consider the opposite parabolic group P^- of P with respect to $Z_G(S)$; it is the unique k -parabolic subgroup Q of G containing $Z_G(S)$ such that $Q \cap P = Z_G(S)$ [3, §4.8]. Let U^- be the unipotent radical of P^- . As $P \cap U^- = 1$, each fiber of the multiplication map $U \times Z_G(S) \times U^- \rightarrow G$ consists of a single point, so this map is an open immersion by [2, Prop. AG 18.4]. So by Proposition 11 of [15], we have $(U \times Z_G(S) \times U^-)(k)/R = G(k)/R$. But U and U^- are affine spaces, so one has an isomorphism $Z_G(S)(k)/R \xrightarrow{\sim} G(k)/R$. We denote by $T = Z_G(S)^{\text{tor}} = Z_G(S)/Z_G(S)^{\text{ss}}$ the coradical torus of $Z_G(S)$; the preceding theorem produces then the exact sequence

$$Z_G(S)^{\text{ss}}(k)/R \rightarrow Z_G(S)(k)/R \rightarrow T(k)/R \rightarrow 1.$$

As $Z_G(S)$ is a Levi subgroup of P , we have a natural isomorphism $P^{\text{tor}} \xrightarrow{\sim} Z_G(S)^{\text{tor}} = T$. According to Lemma 5.6 of [12], the fact that G is simply connected implies that the torus $T = P^{\text{tor}}$ is quasi-trivial. So we have $T(k)/R = 1$ and the map $Z_G(S)^{\text{ss}}(k)/R \rightarrow G(k)/R$ is surjective.
