Chapter 1

Gap 3

1.1 The Preparation Forcing

We assume GCH.

A condition in the preparation forcing $\mathcal{P}'$, which we define below, will consists basically of an elementary chain of models of cardinality $\kappa^{++}$ and a directed system elementary submodels of cardinality $\kappa^+$. Inside this directed system a crucial role will be played by a certain elementary chain which will be called central line. Let us give first a definition of both elementary chains.

Definition 1.1.1 The set $\mathcal{P}''$ consists of elements of the form

$$\langle B^{1_\kappa^+}, A^{1_\kappa^{++}} \rangle$$

so that the following hold:

1. $A^{1_\kappa^{++}}$ is a continuous closed chain of length less than $\kappa^{+3}$ of elementary submodels of $\langle H(\kappa^{+3}), \in, <, \subseteq, \kappa \rangle$ each of cardinality $\kappa^{++}$.

2. For each $X \in A^{1_\kappa^{++}}$, we have $X \cap \kappa^{+3} \in On$. So, $X \supseteq \kappa^{++}$. Further we shall frequently identify such model $X$ with the ordinal $X \cap \kappa^{+3}$ and also view $A^{1_\kappa^{++}}$ as a closed set of ordinals.

3. If $X$ is a non-limit element of the chain $A^{1_\kappa^{++}}$ then

   (a) $A^{1_\kappa^{++}} \upharpoonright X := \{ Y \mid Y \subset X, Y \in A^{1_\kappa^{++}} \} \in X$,
   (b) $\kappa^+ X \subseteq X$. 

5
4. $B^{1\kappa^+}$ is a continuous closed chain of length less than $\kappa^{++}$ of elementary submodels of $\langle H(\kappa^{+3}), \in, <, \subseteq, \kappa \rangle$, each of cardinality $\kappa^+$. $B^{1\kappa^+}$ has the last element which we denote by $\max(B^{1\kappa^+})$.

5. For each $X \in B^{1\kappa^+}$, we have $X \cap \kappa^{++} \in On$. Hence $X \supseteq \kappa^+$.

6. If $X$ is a non-limit element of the chain $B^{1\kappa^+}$ then
   
   (a) $B^{1\kappa^+} \upharpoonright X := \langle Y \mid Y \subset X, Y \in B^{1\kappa^+} \rangle \in X$,
   
   (b) $\kappa X \subseteq X$,
   
   (c) If $\delta < \sup(X)$ for some $\delta \in A^{1\kappa^{++}}$ (we identify here an element of $A^{1\kappa^{++}}$ with an ordinal), then $\min((X \cap On) \setminus \delta) \in A^{1\kappa^{++}}$.

   The following technical notion will be needed in order to define $P'$ (and will be used further as well).

**Definition 1.1.2** Suppose that $\langle B^{1\kappa^+}, A^{1\kappa^{++}} \rangle \in P''$, $F \in B^{1\kappa^+}$ and $F_0, F_1 \in F$. We say that the triple $F_0, F_1, F$ is of $\Delta$-system type iff

1. $F_0$ is the immediate predecessor of $F$ in the chain $B^{1\kappa^+}$,

2. $F_1 \prec F$,

3. If $\delta < \sup(F_1 \cap On)$ for some $\delta \in A^{1\kappa^{++}}$, then $\min((F_1 \cap On) \setminus \delta) \in A^{1\kappa^{++}}$.

4. There are $\alpha_0, \alpha_1 \in A^{1\kappa^{++}}$ such that
   
   (a) $\cof(\alpha_0) = \cof(\alpha_1) = \kappa^{++}$,
   
   (b) $\alpha_0 \in F_0$ and $\alpha_1 \in F_1$,
   
   (c) $F_0 \cap F_1 \cap On = F_0 \cap \alpha_0 = F_1 \cap \alpha_1$,
   
   (d) either $\alpha_0 > \sup(F_1 \cap On)$ or $\alpha_1 > \sup(F_0 \cap On)$.

   Intuitively, this means that $F_0, F_1$ behave as in a $\Delta$-system with the common part below $\min(\alpha_0, \alpha_1)$.

   Further let us call $\alpha_0, \alpha_1$ the witnessing ordinals for $F_0, F_1, F$.

   The next condition will require more similarity:
5. (isomorphism condition) the structures
\[ \langle F_0, \in, <, \subseteq, \kappa, A^{1\kappa^+} \cap F_0, f_{F_0} \rangle \]
and
\[ \langle F_1, \in, <, \subseteq, \kappa, A^{1\kappa^+} \cap F_1, f_{F_1} \rangle \]
are isomorphic over \( F_0 \cap F_1 \), i.e. the isomorphism \( \pi_{F_0F_1} \) between them is the identity on \( F_0 \cap F_1 \), where \( f_{F_0} : \kappa^+ \leftrightarrow F_0 \), \( f_{F_1} : \kappa^+ \leftrightarrow F_1 \) are some fixed in advance bijections.

It is possible for gap 3 to do without \( f_{F_i} \).

Note that, in particular, we will have that \( \text{otp}(F_0) = \text{otp}(F_1) \) and \( F_0 \cap \kappa^+ = F_1 \cap \kappa^+ \).

**Definition 1.1.3** The set \( P' \) consists of elements of the form
\[ \langle \langle A^{0\kappa^+}, A^{1\kappa^+}, C^{\kappa^+} \rangle, A^{1\kappa^+} \rangle \]
so that the following hold:

1. \( A^{0\kappa^+} \in A^{1\kappa^+} \),
2. every \( X \in A^{1\kappa^+} \) is either equal to \( A^{0\kappa^+} \) or belongs to it,
3. \( C^{\kappa^+} : A^{1\kappa^+} \to P(A^{1\kappa^+}) \),
4. for every \( X \in A^{1\kappa^+} \), \( \langle C^{\kappa^+}(X), A^{1\kappa^+} \rangle \in P' \) and \( X \) is the maximal model of \( C^{\kappa^+}(X) \).
   In particular, each \( C^{\kappa^+}(X) \) is an increasing continuous chain of models of cardinality \( \kappa^+ \).
5. (Coherence) If \( X, Y \in A^{1\kappa^+} \) and \( X \in C^{\kappa^+}(Y) \), then \( C^{\kappa^+}(X) \) is an initial segment of \( C^{\kappa^+}(Y) \) with \( X \) being the largest element of it.
   We call \( C^{\kappa^+}(A^{0\kappa^+}) \) central line of \( \langle \langle A^{0\kappa^+}, A^{1\kappa^+}, C^{\kappa^+} \rangle, A^{1\kappa^+} \rangle \). The following conditions describe a special way in which \( A^{1\kappa^+} \) is generated from the central line.
6. Let \( B \in A^{1\kappa^+} \). Then \( B \in C^{\kappa^+}(A^{0\kappa^+}) \) (i.e., it is on the central line) or there are \( n < \omega \) and sequences \( \langle A_1, ..., A_n \rangle, \langle B_1, ..., B_n \rangle \) of elements of \( A^{1\kappa^+} \) such that
   a. \( A_1 \in C^{\kappa^+}(A^{0\kappa^+}) \) is the least model of the central line \( C^{\kappa^+}(A^{0\kappa^+}) \) that contains \( B \).
   b. \( A_1 \) is a successor model in \( C^{\kappa^+}(A^{0\kappa^+}) \). Let \( A_1^- \) denotes its immediate predecessor in \( C^{\kappa^+}(A^{0\kappa^+}) \).
The triple $A_1^-, B_1, A_1$ is of a $\Delta$-system type with respect to $A^{1\kappa^{++}}$.

For each $m, 1 < m \leq n$,

i. $A_m \in C^{\kappa^+}(B_{m-1})$ (i.e. it is on the central line of $B_{m-1}$) is the least model in $C^{\kappa^+}(B_{m-1})$ that contains $B$.

ii. $A_m$ is a successor model in $C^{\kappa^+}(B_{m-1})$. Let $A^-_m$ denotes its immediate predecessor in $C^{\kappa^+}(B_{m-1})$.

iii. The triple $A^-_m, B_m, A_m$ is of a $\Delta$-system type with respect to $A^{1\kappa^{++}}$.

$B \in C^{\kappa^+}(B_n)$.

We refer to the sequence $\langle A_1, A^-_1, B_1, ..., A_{n-1}, A^-_{n-1}, B_{n-1}, A_n, A^-_n, B_n \rangle$ as the piste from $A^{0\kappa^+}$ (or from the central line) to $B$. Denote it by $\text{pst}(A^{0\kappa^+}, B)$.

Let us call $n$ distance of $B$ from the central line, denote it by $\text{dcl}(B)$. If it is on the central line, then set $\text{dcl}(B) = 0$.

The next condition strengthens a bit the isomorphism condition (5) of Definition 1.1.2.

7. (isomorphism condition) Let $F_0, F_1, F \in A^{1\kappa^+}$ be of a $\Delta$-system type and $X \in A^{1\kappa^+}$. Then $X \in F_0$ iff $\pi_{F_0 F_1}[X] \in F_1 \cap A^{1\kappa^+}$. This means that the structures of 1.1.2(5) remain isomorphic even if we add $F_0 \cap A^{1\kappa^+}$ to the first and $F_1 \cap A^{1\kappa^+}$ to the second.

8. (uniqueness) Let $F_0, F_1, F'_1, F \in A^{1\kappa^+}$. If both triples $F_0, F_1, F$ and $F_0, F'_1, F$ are of a $\Delta$-system type, then $F_1 = F'_1$.

Note that both conditions 7, 8 can be stated equivalently only in the case when $F$ is on the central line.

Let us define also a piste to an ordinal.

**Definition 1.1.4** Let $\langle \langle A^{0\kappa^+}, A^{1\kappa^+}, C^{\kappa^+} \rangle, A^{1\kappa^{++}} \rangle \in \mathcal{P}'$ and $\alpha \in A^{1\kappa^{++}} \cap A^{0\kappa^+}$. The sequence $\langle A_1, A^-_1, B_1, ..., A_{n-1}, A^-_{n-1}, B_{n-1}, A_n, A^-_n, A^{1\kappa^{++}}_n \rangle$ of elements of $A^{1\kappa^+}$ is called a piste from $A^{0\kappa^+}$ to $\alpha$ iff

1. $A_1 \in C^{\kappa^+}(A^{0\kappa^+})$ is the least model of $C^{\kappa^+}(A^{0\kappa^+})$ with $\alpha \in A_1$.

2. either
• $A_1$ is the least model of $C^{\kappa^+}(A^{0\kappa^+})$ and then $A^-_n = A_1$, i.e. the piste consists of $A_1$ alone,

or

• $A^-_1$ exists, it is the immediate predecessor of $A_1$ on $C^{\kappa^+}(A^{0\kappa^+})$. If $A^-_1$ is the unique immediate predecessor of $A_1$, or there is an other one but $\alpha$ does belong to it, then the piste consists of $(A_1, A^-_1)$. Otherwise, $A^-_1, B_1, A_1$ are of $\Delta$-system type, $\alpha \in B_1$ and the piste continues.

3. For each $m, 1 < m \leq n$,

(a) $A_m \in C^{\kappa^+}(B_{m-1})$ (i.e. it is on the central line of $B_{m-1}$) is the least model in $C^{\kappa^+}(B_{m-1})$ with $\alpha \in A_m$, either

• $A_m$ is the least model of $C^{\kappa^+}(B_{m-1})$ and then $B^-_n = A_m$,

or

• $A^-_m$ exists, it is the immediate predecessor of $A_m$ on $C^{\kappa^+}(B_{m-1})$. If $A^-_m$ is the unique immediate predecessor of $A_m$, or there is an other one but $\alpha$ does belong to it, then $A^-_n = A^-_m$. Otherwise, $A^-_m, B_m, A_m$ are of $\Delta$-system type, $\alpha \in B_m$ and the piste continues.

4. $\alpha \in A_n$ and either

• $A_n$ is the least model of $C^{\kappa^+}(B_{n-1})$ and then $A^-_n = A_{n1} = A_n$, i.e. the piste terminates at $A_n$;

or

• there exists the immediate predecessor of $A_n$ in $C^{\kappa^+}(B_{n-1})$. Then $A^-_n$ is this immediate predecessor of $A_n$ and there is no $Z \in A^{1\kappa^+}$ such that $A^-_n, Z, A_n$ is of a $\Delta$-system type. In this case $A_{n1} = A^-_n$ and the piste terminates at $A^-_n$;

or

• there exists the immediate predecessor of $A_n$ in $C^{\kappa^+}(B_{n-1})$. Then $A^-_n$ is this immediate predecessor of $A_n$ and there is $Z \in A^{1\kappa^+}$ such that $A^-_n, Z, A_n$ is of a $\Delta$-system type, witnessed by $\xi_0 \in A^-_n \cap A^{1\kappa^{++}}, \xi_1 \in Z \cap A^{1\kappa^{++}}$. Then $\alpha \not\in Z$. If $\alpha \not\in [\xi_1, \sup(Z)]$, then $A_{n1} = A^-_n$ and the piste to $\alpha$ terminates at $A^-_n$. If $\alpha \in [\xi_1, \sup(Z)]$, then $A_{n1} = Z$.

Note that pistes to ordinals terminate by the last model $A_n$ to which the ordinal belongs followed by its immediate predecessor in $C^{\kappa^+}(A_n)$, whenever such predecessor exists.
Definition 1.1.5 (Complexity of pistes)
Let \( \langle \langle A^{0\kappa^+}, A^{1\kappa^+}, C^{\kappa^+}\rangle, A^{1\kappa^{++}} \rangle \in \mathcal{P}' \).

- Suppose that \( A, B \in A^{1\kappa^+} \). We say that the piste from \( A^{0\kappa^+} \) to \( A \) is \textit{simpler} than the piste from \( A^{0\kappa^+} \) to \( B \) iff
  
  1. \( A \subseteq B \), or
  
  2. \( A \not\subseteq B, B \not\subseteq A, A \neq B \) and if \( F \in A^{1\kappa^+} \) is the last common point of both pistes, then \( A \subseteq F_0 \), where \( F_0 \) is the immediate predecessor of \( F \) in \( C^{\kappa^+}(F) \). Note that necessarily, there is \( F_1 \in A^{1\kappa^+} \) such that \( F_0, F_1, F \) is a triple of a \( \Delta \)-system type and \( B \subseteq F_1 \).

- Suppose that \( A \in A^{1\kappa^+} \) and \( \alpha \in A^{1\kappa^{++}} \cap A^{0\kappa^+} \). We say that the piste from \( A^{0\kappa^+} \) to \( A \) is \textit{simpler} than the piste from \( A^{0\kappa^+} \) to \( \alpha \) iff
  
  1. \( A \) is one of the models of the piste to \( \alpha \),
  
  or
  
  2. if \( F \) is the last common model of the pistes, then \( A \in C^{\kappa^+}(F) \), or \( A \not\in C^{\kappa^+}(F) \) and \( A \subseteq F_0 \), where \( F_0 \) is the immediate predecessor of \( F \) in \( C^{\kappa^+}(F) \). Note, if the second possibility occurs, then, necessarily, there is \( F_1 \in A^{1\kappa^+} \) such that \( F_0, F_1, F \) is a triple of a \( \Delta \)-system type and \( \alpha \in F_1 \).

- Suppose that \( \alpha, \beta \in A^{1\kappa^{++}} \cap A^{0\kappa^+} \). We say that the piste from \( A^{0\kappa^+} \) to \( \alpha \) is \textit{simpler} than the piste from \( A^{0\kappa^+} \) to \( \beta \) iff \( \alpha \neq \beta \), there is \( F \in A^{1\kappa^+} \) which is the last common point of both pistes and
  
  1. there are \( D, E \in C^{\kappa^+}(F) \) such that \( \alpha \in D \subseteq E \) and \( \beta \in E \setminus D \),
  
  or
  
  2. there are \( F_0, F_1 \in A^{1\kappa^+} \) such that \( F_0, F_1, F \) are of a \( \Delta \)-system type, \( F_0 \in C^{\kappa^+}(F) \), \( \alpha \in F_0 \) and \( \beta \in F_1 \),
  
  3. there are \( F_0, F_1 \in A^{1\kappa^+} \) such that \( F_0, F_1, F \) are of a \( \Delta \)-system type, \( F_0 \in C^{\kappa^+}(F) \), \( \xi_0, \xi_1 \) the witnessing ordinals, and \( \beta \in F \setminus (F_0 \cup F_1) \), \( \xi_1 \leq \beta \leq \operatorname{sup}(F_1) \) and \( \alpha \in F_1 \),
  
  or
  
  4. there are \( F_0, F_1 \in A^{1\kappa^+} \) such that \( F_0, F_1, F \) are of a \( \Delta \)-system type, \( F_0 \in C^{\kappa^+}(F) \), \( \xi_0, \xi_1 \) the witnessing ordinals, and \( \alpha \in F \setminus (F_0 \cup F_1) \), \( \beta \in F_1 \) and \( \alpha < \xi_1 \) or \( \alpha > \operatorname{sup}(F_1) \).

10
The above defines a well-founded relation. We will use further the pistes complexity in inductive arguments.

**Lemma 1.1.6** Let \( \langle A^{0^c+}, A^{1^c+}, C^{c^+} \rangle, A^{1^{c^+}} \rangle \in P' \) and \( B \in A^{1^c+} \). Then

1. \( \langle B, A^{1^c+} \cap (B \cup \{B\}), C^{c^+} \upharpoonright A^{1^c+} \cap (B \cup \{B\}), A^{1^{c^+}} \rangle \in P' \).

2. If \( B' \in A^{1^c+} \) and \( B' \not\subseteq B \), then \( B' \in B \).

**Proof.** We prove both statements simultaneously by an induction on \( dcl(B) \) -the distance from the central line. If \( B \) is on the central line, then it is clear. Suppose that \( B \) is not on the central line. Consider the piste \( \langle A_1, A_1^-, B_1, \ldots, A_{n-1}, A_{n-1}^-, B_{n-1}, A_n, A_n^-, B_n \rangle \) from \( A^{0^c+} \) to \( B \). We have

\[
\langle \langle A_1^-, A^{1^c+} \cap (A_1^- \cup \{A_1^-\}), C^{c^+} \upharpoonright A^{1^c+} \cap (A_1^- \cup \{A_1^-\}), A^{1^{c^+}} \rangle, A^{1^{c^+}} \rangle \in P'.
\]

Recall that \( A_1^-, B_1, A_1 \) are of the \( \Delta \)-system type. Hence we have the isomorphism \( \pi_{A_1^-, B_1} \) between \( A_1^- \) and \( B_1 \) which preserves all the relevant structure. In particular, it will move the piste from \( A_1^- \) to a model in \( A^{1^c+} \cap (A_1^- \cup \{A_1^-\}) \) to the piste from \( B_1 \) to the corresponding under \( \pi_{A_1^-, B_1} \) model of \( A^{1^c+} \cap (B_1 \cup \{B_1\}) \). This easily implies that

\[
\langle \langle B_1, A^{1^c+} \cap (B_1 \cup \{B_1\}), C^{c^+} \upharpoonright A^{1^c+} \cap (B_1 \cup \{B_1\}), A^{1^{c^+}} \rangle, A^{1^{c^+}} \rangle \in P'.
\]

Suppose now that we have some \( B' \in A^{1^c+} \), \( B' \not\subseteq B_1 \). If \( B' \not\subseteq A_1^- \), then the piste from \( A^{0^c+} \) to \( B' \) goes via \( B_1 \), and hence \( B' \in B_1 \). Suppose that \( B' \subseteq A_1^- \). It is impossible to have \( B' = A_1^- \), since then

\[ A_1^- \cap B_1 \supseteq B' \]

which is clearly not the case. So, \( B' \subseteq A_1^- \). Then the piste from \( A^{0^c+} \) to \( B' \) goes via \( A_1^- \), and hence \( B' \in A_1^- \). Then \( \pi_{A_1^-, B_1}(B') \in B_1 \), but

\[ \pi_{A_1^-, B_1}(B') = \pi_{A_1^-, B_1} \circ B' = B'. \]

So we are done.

Hence, \( A^{1^c+} \cap (B_1 \cup \{B_1\}) = A^{1^c+} \cap P(B_1) \).

Now we deal with \( B \) and \( \langle \langle B_1, A^{1^c+} \cap (B_1 \cup \{B_1\}), C^{c^+} \upharpoonright A^{1^c+} \cap (B_1 \cup \{B_1\}), A^{1^{c^+}} \rangle, A^{1^{c^+}} \rangle \in P' \).

The piste distance from \( B_1 \) to \( B \) is shorter than those from \( A^{0^c+} \) to \( B \). So the induction hypothesis applies.

\( \square \)

The next lemma is trivial.
Lemma 1.1.7 Let $\langle\langle A^{0κ}, A^{1κ}, C^{κ^+}\rangle, A^{1κ^+}\rangle \in \mathcal{P}'$ and $Z \in A^{1κ^+}$ is so that $Z \cap κ^+3 \geq \sup(A^{0κ})$. Then $\langle\langle A^{0κ}, A^{1κ}, C^{κ^+}\rangle, \{Y \in A^{1κ^+} \mid Y \subseteq Z\}\rangle \in \mathcal{P}'$.

Let us introduce the following notation:

Definition 1.1.8 Let $p = \langle\langle A^{0κ}, A^{1κ}, C^{κ^+}\rangle, A^{1κ^+}\rangle \in \mathcal{P}'$ and $B \in A^{1κ^+}$. Then set

$$p \upharpoonright B := \langle\langle B, A^{1κ^+} \cap (B \cup \{B\}), C^{κ^+} \upharpoonright (B \cup \{B\}), A^{1κ^+}\rangle.$$ 

We call $p \upharpoonright B$ the restriction of $p$ to $B$.

Similar, if $Z \in A^{1κ^+}$, then set

$$p \upharpoonright Z := \langle\langle A^{0κ}, A^{1κ}, C^{κ^+}\rangle, \{Y \in A^{1κ^+} \mid Y \subseteq Z\}\rangle.$$ 

Also, let $p \upharpoonright (B, Z) := (p \upharpoonright B) \upharpoonright Z$.

By the previous lemmas, $p \upharpoonright (B, Z) \in \mathcal{P}'$.

The next lemma follows easily from the definitions.

Lemma 1.1.9 Let $\langle\langle A^{0κ}, A^{1κ}, C^{κ^+}\rangle, A^{1κ^+}\rangle \in \mathcal{P}'$, $A \in A^{1κ^+}$ and $δ \in A^{1κ^+}$. If $δ < \sup(A)$, then $\min(A \setminus δ) \in A^{1κ^+}$.

**Proof.** By 1.1.3(4), $\langle C^{κ^+}(A), A^{1κ^+}\rangle \in \mathcal{P}''$. So, it satisfies 1.1.1(6(d)) and we are done, if $A$ is a successor model of $C^{κ^+}(A)$. Suppose $A$ is a limit model of $C^{κ^+}(A)$. Let $\langle A_i \mid i < η\rangle$ be an increasing sequence of successor models of $C^{κ^+}(A)$ with $\bigcup_{i<η} A_i = A$. Now, $δ < \sup(A)$, so starting with some $i^* < η$, we have $δ < \sup(A_i)$. Just note that $i < j$ implies $A_i \in A_j$, hence $\langle \sup(A_i) \mid i < η\rangle$ is an increasing sequence of ordinals with limit $\sup(A)$. Set $α_i = \min(A_i \setminus δ)$, for each $i, i^* \leq i < η$. By 1.1.1(6(d)), $α_i \in A^{1κ^+}$. Clearly, $i \geq j$ implies $α_i \leq α_j$. Hence, the sequence $\langle α_i \mid i^* \leq i < η\rangle$ is eventually constant. Let $α^*$ be this constant value. Then $\min(A \setminus δ) = α^*$ and we are done.

□

Definition 1.1.10 Let $\langle\langle A^{0κ}, A^{1κ}, C^{κ^+}\rangle, A^{1κ^+}\rangle \in \mathcal{P}'$ and $A, B \in A^{1κ^+}$. We say that $A$ satisfies the intersection property with respect to $B$ or shortly $ip(A, B)$ iff either

1. $A \supseteq B$, or
2. $B \supseteq A$, or
3. \( A \not\supset B, B \not\supset A \), and then there are \( A' \in A^{1\kappa^+} \cap (A \cup \{A\}) \) and \( \eta \in A^{1\kappa^+} \cap A' \) such that
\[
A \cap B = A' \cap \eta,
\]
or just
\[
A \cap B = A'.
\]

Let \( ipb(A, B) \) denotes that both \( ip(A, B) \) and \( ip(B, A) \) hold.

**Lemma 1.1.11 (The intersection lemma)** Let \( \langle \langle A^{0\kappa^+}, A^{1\kappa^+}, C^{\kappa^+} \rangle, A^{1\kappa^+} \rangle \in P \) and \( X, Y \in A^{1\kappa^+} \). Then \( ipb(X, Y) \).

**Proof.** Assume that \( X \not\supset Y, Y \not\supset X \).

Consider the pistes \( \langle A_{-k+1}, A_{k-1}, B_{n-1}, A_n, A_n, B_n \rangle \) from \( A^{0\kappa^+} \) to \( X \) and
\[
\langle D_{-m-1}, D_{m-1}, E_{m-1}, D_m, D_n, E_n \rangle \) from \( A^{0\kappa^+} \) to \( Y \).

Let \( B_k = E_k \) be the last place up to which the pistes coincide. Then we have both \( A_{k+1}, D_{k+1} \in C^{\kappa^+}(B_k) \) but at different places.

Suppose first that \( A_{k+1} \) is above \( D_{k+1} \). Then \( A_{-k+1} = D_{k+1} \) or \( A_{k+1} \supset D_{k+1} \), and then \( D_{k+1} \in A_{-k+1} \). Now, \( A_{-k+1}, B_{k+1}, A_{k+1} \) are of a \( \Delta \)-system type. Hence by Definition 1.1.2(6), there are ordinals \( \alpha_0, \alpha_1 \in A^{1\kappa^+} \cap A_{k+1}, \alpha_0 \in A_{-k+1} \) and \( \alpha_1 \in B_{k+1} \) such that
\[
A_{-k+1} \cap B_{k+1} = A_{-k+1} \cap \alpha_0 = B_{k+1} \cap \alpha_1.
\]

Recall that \( X \subseteq B_{k+1} \) and \( Y \subseteq A_{-k+1} \). Hence,
\[
X \cap Y = (X \cap B_{k+1}) \cap (Y \cap A_{-k+1}) = (X \cap \alpha_1) \cap (Y \cap \alpha_0).
\]

Let us use (7) of 1.1.3. Then
\[
X' = \pi_{A_{-k+1}} \left[ X \right] \in A_{k+1} \cap A^{1\kappa^+}.
\]

Also,
\[
X \cap \alpha_1 = X' \cap \alpha_0,
\]

since the isomorphism \( \pi_{A_{-k+1}} \) is the identity over \( B_{k+1} \cap A_{-k+1} \). Hence,
\[
X \cap Y = X \cap \alpha_1 \cap Y = X' \cap \alpha_0 \cap Y.
\]

Consider
\[
p := \langle \langle A_{k+1}^{1\kappa^+} \cap (A_{k+1}^{1\kappa^+} \cup \{A_{k+1}^{1\kappa^+}\}), C^{\kappa^+} \mid A^{1\kappa^+} \cap (A_{k+1}^{1\kappa^+} \cup \{A_{k+1}^{1\kappa^+}\}) \rangle, A^{1\kappa^+} \rangle.
\]
By Lemma 1.1.6, it is in $P'$. We can apply the inductive hypothesis to $p,X'$ and $Y$, since the piste from $A_{k+1}^{-}$ to $X'$ shorter than those from $A^{0k+}$ to $X$ (it is just a copy under $\pi_{B_{k+1}, A_{k+1}^{-}}$ of the final segment $\langle B_{k+1}, ..., A_n, A_{n}^{-}, B_n \rangle$ of the original piste to $X$ from $A^{0k+}$). Hence there are $Y' \in A^{1k+} \cap (Y \cup \{Y\})$ and $\eta \in A^{1k++} \cap Y'$ such that $X' \cap Y = Y' \cap \eta$.

Then $X \cap Y = Y \cap Y' \cap \eta \cap \alpha_0$.

If $\alpha_0 \in Y$, then we are done. Suppose otherwise. If $\alpha_0 \geq \sup(Y)$, then we can just remove it from the intersection above. If $\alpha_0 < \sup(Y)$, then replace it by $\min(Y \cap \alpha_0)$, which is in $A^{1k++}$ by Lemma 1.1.9.

This shows $ip(Y,X)$. Finally, using $\pi_{A_{k+1}^{-}, B_{k+1}}$ and moving $Y$ to $B_{k+1}$, the same argument shows $ip(X,Y)$.

It is easy to deduce the following generalization using an induction:

**Lemma 1.1.12** Let $\langle A^{0k+}, A^{1k+}, C^{\kappa+} \rangle, A^{1k++} \rangle \in P' \text{ and } A_1, ..., A_n \in A^{1k+}$, for some $n < \omega$. Then there are $A' \in A^{1k+} \cap (A_1 \cup \{A_1\})$ and $\eta \in A^{1k++} \cap A'$ such that $A_1 \cap ... \cap A_n = A' \cap \eta$ or just $A_1 \cap ... \cap A_n = A'$.

We need to allow a possibility to change the component $C^{\kappa+}$ in elements of $P'$ and replace one central line by another. It is essential for the definition of an order on $P'$ given below.

**Definition 1.1.13** Let $p = \langle A^{0k+}, A^{1k+}, C^{\kappa+}, A^{1k++} \rangle \in P'$ and $B \in A^{1k+}$. Define $swt(p,B)$ (here $swt$ stands for switch) to be

$$\langle A^{0k+}, A^{1k+}, D^{\kappa+}, A^{1k++} \rangle,$$

where $D^{\kappa+}$ is obtained from $C^{\kappa+}$ as follows:

$D^{\kappa+} = C^{\kappa+}$ unless $B$ has exactly two immediate predecessors in $A^{1k+}$. If $B_0 \neq B_1$ are such predecessors of $B$ and, say $B_0 \in C^{\kappa+}(B)$, then we set $D^{\kappa+}(B) = C^{\kappa+}(B_1) \cap B$. Extend $D^{\kappa+}$ on the rest in the obvious fashion just replacing $C^{\kappa+}(B_0)$ by $C^{\kappa+}(B_1)$ for models including $B$ and then moving over isomorphic models.

Intuitively, we switched here from $B_0$ to $B_1$.

Note that $swt(swt(p,B), B) = p$.

Define $q = swt(p, B_1, \ldots, B_n)$ by applying the operation $swt$ $n$-times:

14
\[ p_{i+1} = \text{swt}(p_i, B_i), \text{ for each } 1 \leq i \leq n, \text{ where } p_1 = p \text{ and } q = p_{n+1}. \]

The following simple observation will be useful further.

**Lemma 1.1.14** Let \( p = \langle A^{0\kappa^+}(p), A^{1\kappa^+}(p), C^{\kappa^+}(p), A^{1\kappa^{++}}(p) \rangle \in \mathcal{P}' \) and \( B \in A^{1\kappa^+}(p) \). Then there are \( E_1, \ldots, E_m \in A^{1\kappa^+}(p) \) such that \( B \in C^{\kappa^+}(q)(A^{0\kappa^+}(p)) \), where

\[ q = \langle A^{0\kappa^+}(p), A^{1\kappa^+}(p), C^{\kappa^+}(q), A^{1\kappa^{++}}(p) \rangle = \text{swt}(p, E_1, \ldots, E_m). \]

**Proof.** If \( B \in C^{\kappa^+}(q)(A^{0\kappa^+}(p)) \), then let \( q = p \). Suppose otherwise. Consider the piste \( A_1, A_1^-, B_1, \ldots, A_n^-, A_{n-1}^-, B_{n-1}, A_n, A_n^-, B_n \) from \( A^{0\kappa^+} \) to \( B \). Then

\[ q = \langle A^{0\kappa^+}(p), A^{1\kappa^+}(p), C^{\kappa^+}(q), A^{1\kappa^{++}}(p) \rangle = \text{swt}(p, A_1^-, B_1, A_2^-, B_2, \ldots, A_n^-, B_n) \]

will be as desired.

\( \Box \)

**Definition 1.1.15** Let \( r, q \in \mathcal{P}' \). Then \( r \geq q \) (\( r \) is stronger than \( q \)) iff there is \( p = \text{swt}(r, B_1, \ldots, B_n) \) for some \( B_1, \ldots, B_n \) appearing in \( r \) so that the following hold, where

\[ p = \langle A^{0\kappa^+}, A^{1\kappa^+}, C^{\kappa^+}, A^{1\kappa^{++}} \rangle \]

\[ q = \langle B^{0\kappa^+}, B^{1\kappa^+}, D^{\kappa^+}, B^{1\kappa^{++}} \rangle \]

(1.1) \( A^{1\kappa^{++}} \cap (\max(B^{1\kappa^{++}}) + 1) = B^{1\kappa^{++}} \)

(1.2) \( B^{0\kappa^+} \in C^{\kappa^+}(A^{0\kappa^+}) \) and \( D^{\kappa^+}(B^{0\kappa^+}) \) is an initial segment of \( C^{\kappa^+}(A^{0\kappa^+}) \)

(1.3) \( q = p \upharpoonright (B^{0\kappa^+}, B^{0\kappa^{++}}) \) (as it was defined in 1.1.8).

**Remarks** (1) Note that if \( t = \text{swt}(p, B_0, \ldots, B_n) \) is defined, then \( t \geq p \) and

\[ p = \text{swt}(\text{swt}(p, B_0, \ldots, B_n), B_n, B_{n-1}, \ldots, B_0) = \text{swt}(t, B_n, \ldots, B_0) \geq t \]

. Hence the switching produces equivalent conditions.

(2) We need to allow \( \text{swt}(p, B) \) for the \( \Delta \)-system argument. Since in this argument two conditions are combined into one and so \( C^{\kappa^+} \) should pick one of them only. Also it is needed for proving a strategic closure of the forcing.

(3) The use of finite sequences \( B_0, \ldots, B_n \) is needed in order to insure transitivity of the order \( \leq \) on \( \mathcal{P}' \).

Let \( p = \langle A^{0\kappa^+}, A^{1\kappa^+}, C^{\kappa^+}, A^{1\kappa^{++}} \rangle \in \mathcal{P}' \). Set \( p \setminus \kappa^{++} = A^{1\kappa^{++}} \). Define \( \mathcal{P}'_{\geq \kappa^{++}} \) to be the set of all \( p \setminus \kappa^{++} \) for \( p \in \mathcal{P}' \).

The next lemma is obvious.
Lemma 1.1.16 \( \langle P_{\geq \kappa^{++}}, \leq \rangle \) is \( \kappa^{+3} \)-closed.

Set \( p \restriction \kappa^{++} = \langle A_{0}^{0\kappa^{+}}, A_{1}^{1\kappa^{+}}, C_{\kappa^{+}}^{\kappa^{+}} \rangle \) where \( p = \langle \langle A_{0}^{0\kappa^{+}}, A_{1}^{1\kappa^{+}}, C_{\kappa^{+}}^{\kappa^{+}} \rangle, A_{1}^{1\kappa^{+}} \rangle \in P' \).

Let \( G(P'_{\geq \kappa^{++}}) \) be a generic subset of \( P'_{\geq \kappa^{++}} \). Define \( P'_{<\kappa^{++}} \) to be the set of all \( p \restriction \kappa^{++} \) for \( p \in P' \) with \( p \setminus \kappa^{++} \in G(P'_{\geq \kappa^{++}}) \).

Let \( p \in P' \) and \( q \in P'_{\geq \kappa^{++}} \). Then \( q \triangleq p \) denotes the set obtained from \( p \) by adding \( q \) to the last component of \( p \), i.e. to \( A_{1}^{1\kappa^{++}} \).

The following lemma is trivial.

Lemma 1.1.17 Let \( p \in P'_{\geq \kappa^{++}} \) and \( q \geq P'_{\geq \kappa^{++}} p \setminus \kappa^{++} \). Then \( q \triangleq p \in P'_{\geq \kappa^{++}} \) and \( q \triangleq p \geq p \).

It follows now that \( P' \) projects to \( P'_{<\kappa^{++}} \).

Let us turn to the chain condition.

Lemma 1.1.18 The forcing \( P'_{<\kappa^{++}} \) satisfies \( \kappa^{+3} \)-c.c. in \( V^{P'_{\geq \kappa^{++}}} \).

Proof. Suppose otherwise. Let us assume that

\[ \emptyset \upharpoonright P'_{\geq \kappa^{++}} \langle \langle p_{\alpha} = \langle A_{0}^{0\kappa^{+}}_{\alpha}, A_{1}^{1\kappa^{+}}_{\alpha}, C_{\kappa^{+}}^{\kappa^{+}}_{\alpha} \rangle, A_{1}^{1\kappa^{+}}_{\alpha} \rangle \mid \alpha < \kappa^{+3} \rangle \text{ is an antichain in } P'_{<\kappa^{++}} \]

Without loss of generality we can assume that each \( A_{0}^{0\kappa^{+}}_{\alpha} \) is forced to be a successor model, otherwise just extend conditions by adding one additional model on the top. Define by induction, using Lemma 1.1.16, an increasing sequence \( \langle q_{\alpha} \mid \alpha < \kappa^{+3} \rangle \) of elements of \( P'_{\geq \kappa^{++}} \) and a sequence \( \langle p_{\alpha} \mid \alpha < \kappa^{+3} \rangle, p_{\alpha} = \langle A_{0}^{0\kappa^{+}}_{\alpha}, A_{1}^{1\kappa^{+}}_{\alpha}, C_{\kappa^{+}}^{\kappa^{+}}_{\alpha} \rangle \) so that for every \( \alpha < \kappa^{+3} \)

\[ q_{\alpha} \upharpoonright P'_{\geq \kappa^{+3}} \langle \langle A_{0}^{0\kappa^{+}}_{\alpha}, A_{1}^{1\kappa^{+}}_{\alpha}, C_{\kappa^{+}}^{\kappa^{+}}_{\alpha} \rangle, A_{1}^{1\kappa^{+}}_{\alpha} \rangle = \bar{p}_{\alpha} \cdot \]

For a limit \( \alpha < \kappa^{+3} \) let

\[ \bar{q}_{\alpha} = \bigcup_{\beta < \alpha} q_{\beta} \cup \{ \sup \bigcup_{\beta < \alpha} q_{\beta} \} \]

and \( q_{\alpha} \) be its extension deciding \( \bar{q}_{\alpha} \). Also assume that \( \max q_{\alpha} \geq \sup(A_{0}^{0\kappa^{+}}_{\alpha} \cap \kappa^{+3}) \).

We form a \( \Delta \)-system. By shrinking if necessary assume that for some stationary \( S \subseteq \kappa^{+3} \) and \( \delta < \kappa^{+3} \) we have the following for every \( \alpha < \beta \) in \( S \):

(a) \( A_{0}^{0\kappa^{+}}_{\alpha} \cap \alpha = A_{0}^{0\kappa^{+}}_{\beta} \cap \beta \subseteq \delta \)

(b) \( A_{0}^{0\kappa^{+}}_{\alpha} \setminus \alpha \neq \emptyset \)

(c) \( \sup A_{0}^{0\kappa^{+}}_{\alpha} < \beta \)

16
(d) $\sup \bar{q}_\alpha = \alpha + 1$

(e)

\[
\langle A_\alpha^{0\kappa^+}, \in, \subseteq, \kappa, C_\alpha^{\kappa^+}, f_{A_\alpha^{1\kappa^+}}, A_\alpha^{0\kappa^+} \cap A_\alpha^{0\kappa^+} \rangle \\
\langle A_\beta^{0\kappa^+}, \in, \subseteq, \kappa, C_\beta^{\kappa^+}, f_{A_\beta^{1\kappa^+}}, A_\beta^{0\kappa^+} \cap A_\beta^{0\kappa^+} \rangle
\]

are isomorphic over $\delta$, i.e. by isomorphism fixing every ordinal below $\delta$, where

\[
f_{A_\alpha^{0\kappa^+}} : \kappa^+ \longleftrightarrow A_\alpha^{0\kappa^+}
\]

and

\[
f_{A_\beta^{0\kappa^+}} : \kappa^+ \longleftrightarrow A_\beta^{0\kappa^+}
\]

are the fixed enumerations.

We claim that for $\alpha < \beta$ in $S$ it is possible to extend $q_\beta$ to a condition forcing compatibility of $p_\alpha$ and $p_\beta$. Proceed as follows. Pick $A$ to be an elementary submodel of cardinality $\kappa^+$ so that

(i) $A_\alpha^{1\kappa^+}, A_\beta^{1\kappa^+} \in A$

(ii) $C_\alpha^{\kappa^+}, C_\beta^{\kappa^+} \in A$

(iii) $q_\beta \in A$.

Extend $q_\beta$ to $q = q_\beta \cup \sup(A \cap \kappa^+)$. Set $p = \langle A, A^{1\kappa^+}, C^{\kappa^+} \rangle$, where $A^{1\kappa^+} := A_\alpha^{1\kappa^+} \cup A_\beta^{1\kappa^+} \cup \{A\}$, $C^{\kappa^+} := C_\alpha^{\kappa^+} \cup C_\beta^{\kappa^+} \cup (A, C_\beta^{\kappa^+}(A^{0\kappa^+} \cap A))$.

Clearly, $\langle C^{\kappa^+}(A), q \rangle \in \mathcal{P}''$.

The triple $A_\beta^{0\kappa^+}, A_\alpha^{0\kappa^+}, A$ is of a $\Delta$-system type relatively to $q$, by (e) above. It follows that $\langle p, q \rangle \in \mathcal{P}'$. Thus the condition (6) of Definition 1.1.3 holds since each of $\langle p_\alpha, q \rangle, \langle p_\beta, q \rangle$ satisfies it. The condition (7) of Definition 1.1.3 follows from (e) above and since both $\langle p_\alpha, q \rangle, \langle p_\beta, q \rangle$ satisfy it.

\[\square\]

**Lemma 1.1.19** $\mathcal{P}'$ is $\kappa^{++}$-strategically closed.
Proof. We define a winning strategy for the player playing at even stages. Thus suppose
\[ \langle p_j \mid j < i \rangle, p_j = \langle \langle A_j^{0\kappa}, A_j^{1\kappa}, C_j^{\kappa} \rangle, A_j^{1\kappa++} \rangle \]
is a play according to this strategy up to an even stage \( i < \kappa^{++} \). Set first

\[ B_i^{0\kappa} = \bigcup_{j<i} A_j^{0\kappa}, B_i^{1\kappa} = \bigcup_{j<i} A_j^{1\kappa} \cup \{ B_i^{0\kappa} \}, \]

\[ D_i^{\kappa} = \bigcup_{j<i} C_j^{\kappa} \cup \{ \langle B_i^{0\kappa}, \{ B_i^{0\kappa} \} \cup \{ C_j^{\kappa} (A_j^{0\kappa}) \mid j \text{ is even} \} \rangle \} \]

and

\[ B_i^{1\kappa++} = \bigcup_{j<i} B_j^{1\kappa++} \cup \{ \sup \bigcup_{j<i} B_j^{1\kappa++} \}. \]

Then pick \( A_i^{0\kappa} \) to be a model of cardinality \( \kappa^+ \) such that

(a) \( \mathcal{A}_i^{0\kappa} \subseteq A_i^{0\kappa} \)

(b) \( B_i^{0\kappa}, B_i^{1\kappa}, D_i^{\kappa}, B_i^{1\kappa++} \in A_i^{0\kappa}. \)

Set \( A_i^{1\kappa} = B_i^{1\kappa} \cup \{ A_i^{0\kappa} \}, C_i^{\kappa} = D_i^{\kappa} \cup \{ \langle A_i^{0\kappa}, D_i^{\kappa} (B_i^{0\kappa}) \cup \{ A_i^{0\kappa} \} \rangle \} \) and \( A_i^{1\kappa++} = B_i^{1\kappa++} \cup \{ \sup (A_i^{0\kappa} \cap \kappa^{++}) \}. \) As an inductive assumption we assume that at each even stage \( j < i, p_j \) was defined in the same fashion. Then \( p_i = \langle \langle A_i^{0\kappa}, A_i^{1\kappa}, C_i^{\kappa} \rangle, A_i^{1\kappa++} \rangle \) will be a condition in \( \mathcal{P}' \) stronger than each \( p_j \) for \( j < i \). The switching may be required here once moving from an odd stage to its immediate successor even stage.

\[ \square \]

1.2 Suitable structures and assignment functions

In the gap 2 case assignment functions \( a_n \) (those connecting the level \( \kappa \) with level \( \kappa_n, n < \omega \)) were order preserving. In other words \( a_n \) is an isomorphism between structures in the language containing only the predicate for the order relation. Here, in the gap 3 case (and beyond ), \( a_n \)'s will be isomorphisms between structures in more complicated languages.

Let us start with two definitions which will specify relevant structures.

**Definition 1.2.1** A three sorted structure \( \langle \langle X, Y, Z \rangle, C, \in, \subseteq \rangle \) is called *suitable structure* iff

1. \( X \) has a maximal under inclusion element. Denote it by \( \max(X) \).

2. \( Y \subseteq \max(X) \),

18
3. $C$ is a binary relation $X$,

4. $\langle \max(X), X, C, Y \rangle \in P'$, where for every $A \in X$ we identify $C(A)$ with the set 
   $\{B \in X \mid \langle A, B \rangle \in C\}$.

5. $Z = \{t_1 \cap \ldots \cap t_n \mid n < \omega, t_1, \ldots, t_n \in X \cup Y\}$.

Note that by Lemma 1.1.11, an intersection $t_1 \cap \ldots \cap t_n$ above is really simple, thus it is equal to an element of $X$ or of $Y$ or to $s \cap \alpha$, where $s \in X$ and $\alpha \in Y$.

Let $G(P')$ be a generic subset of $P'$.

**Definition 1.2.2** A suitable structure $\langle \langle X, Y, Z \rangle, C, \in, \subseteq \rangle$ is called suitable generic structure iff there is $\langle \langle A^{0c^+}, A^{1\kappa^+}, C^{\kappa^+}, A^{1\kappa^{++}} \rangle \rangle \in G(P')$ such that

1. $\langle \langle X, Y, Z \rangle, C, \in, \subseteq \rangle$ is a substructure (not necessarily elementary) of $\langle \langle A^{1\kappa^+}, A^{1\kappa^{++}}, \{t_1 \cap \ldots \cap t_n \mid n < \omega, t_1, \ldots, t_n \in A^{1\kappa^+} \cup A^{1\kappa^{++}}\} \rangle, C^{\kappa^+}, \in, \subseteq \rangle$,

2. $\max(X) \in C^{\kappa^+}(A^{0c^+})$,

3. $\langle \langle \max(X), X, C, Y \rangle \rangle$ and $\langle \langle A^{0c^+}, A^{1\kappa^+}, C^{\kappa^+}, A^{1\kappa^{++}} \rangle \rangle$ agree about the pistes to members of $X$ and to ordinals in $\max(X) \cap Y$. In other words we require that all the elements of pistes in $\langle \langle A^{0c^+}, A^{1\kappa^+}, C^{\kappa^+}, A^{1\kappa^{++}} \rangle \rangle$ to elements of $X$ and to ordinals in $\max(X) \cap Y$ are in $X$.

Note that, as a condition in $P'$, $\langle \langle \max(X), X, C, Y \rangle \rangle$ need not be weaker than $\langle \langle A^{0c^+}, A^{1\kappa^+}, C^{\kappa^+}, A^{1\kappa^{++}} \rangle \rangle$, and hence it need not be in $G(P')$. Thus, for example, $A^{1\kappa^{++}}$ need not be an end extension of $Y$.

Note also, that any stronger condition $\langle \langle B^{0c^+}, B^{1\kappa^+}, D^{\kappa^+}, B^{1\kappa^{++}} \rangle \rangle \in G(P')$ with $C^{\kappa^+}(A^{0c^+})$ being an initial segment of $D^{\kappa^+}(B^{0c^+})$ will witness that $\langle \langle X, Y, Z \rangle, C, \in, \subseteq \rangle$ is a suitable generic structure.

**Lemma 1.2.3** Let $\langle \langle X, Y, Z \rangle, C, \in, \subseteq \rangle$ be a suitable generic structure as witnessed by $\langle \langle A^{0c^+}, A^{1\kappa^+}, C^{\kappa^+}, A^{1\kappa^{++}} \rangle \rangle \in G(P')$. Suppose that $F_0, F_1, F \in A^{1\kappa^+}$, $F_0, F \in C^{\kappa^+}(A^{0c^+})$ is a triple of a $\Delta$-system type with $\alpha_0, \alpha_1$ as in Definition 1.1.2, and $\alpha_1 \in Y$. Then $F_0, F_1 \in X \cap \max(X), F \in X, \alpha_0 \in \max(X) \cap Y$. 

19
Lemma 1.2.4

□

Lemma 1.2.5

□

Proof. The piste to \( \alpha \) from \( \max(X) \) (or the same from \( A^{0\kappa^+} \)) passes through \( F \) and turns to \( F_1 \). Hence, by 1.2.2(3), \( F_0, F_1, F \in X \). Recall that by 1.2.1(3) we have \( \langle \langle \max(X), X, C \rangle, Y \rangle \in \mathcal{P}' \). Hence \( F_0, F_1, F \) are of a \( \Delta \)-system type in \( \langle \langle \max(X), X, C \rangle, Y \rangle \). Then there are \( \alpha_{0}', \alpha_1 \in F_0 \cap Y, \alpha_1' \in F_1 \cap Y \) such that

\[
F_0 \cap F_1 = F_0 \cap \alpha_{0}' = F_1 \cap \alpha_1'.
\]

But, also

\[
F_0 \cap F_1 = F_1 \cap \alpha_1
\]

and \( \alpha_1, \alpha_1' \in Y \subseteq A^{1\kappa++} \).

Hence, \( \alpha_1 = \alpha_1' \). Finally, \( \alpha_{0}' = \pi_{F_1,F_0}(\alpha_1) = \alpha_0 \). Hence, \( \alpha_0 \in \max(X) \cap Y \).

□

Lemma 1.2.4 Let \( p = \langle \langle X, Y, Z \rangle, C, \epsilon, \subseteq \rangle \) and \( p' = \langle \langle X', Y', Z' \rangle, C', \epsilon, \subseteq \rangle \) be isomorphic suitable structures (even over different cardinals) and \( a \) an isomorphism between them. Suppose that \( F_0, F_1, F \) is a triple in \( X \) of a \( \Delta \)-system type and \( \alpha_0 \in F_0 \cap Y, \alpha_1 \in F_1 \cap Y \) are witnessing this ordinals. Then \( a(F_0), a(F_1), a(F) \) is a triple in \( X' \) of a \( \Delta \)-system type witnessed by \( a(\alpha_0) \) and \( a(\alpha_1) \).

Proof. Obviously, \( \alpha_0 \) and \( \alpha_1 \) are uniquely determined by \( F_0 \) and \( F_1 \).

Denote \( a(F_0) \) by \( F_0', a(F_1) \) by \( F_1', a(F) \) by \( F' \), \( a(\alpha_0) \) by \( \alpha_{0}' \) and \( a(\alpha_1) \) by \( \alpha_1' \). Now, \( F_0', F_1' \in F' \), moreover \( F_0' \) is the immediate predecessor of \( F' \) in \( C(F') \) and \( F_1' \) is an additional predecessor of \( F' \) under the inclusion relation, since \( a \) is an isomorphism between \( p \) and \( p' \). Note that by 1.2.1(3) this implies that \( F_0', F_1', F' \) is a \( \Delta \)-system type triple in \( p' \).

Let \( \alpha_{0}' \in F_0' \cap a(Y) \) and \( \alpha_1' \in F_1' \cap a(Y) \) be such that

\[
F_0' \cap F_1' = F_0' \cap \alpha_{0}' = F_1' \cap \alpha_1'.
\]

Also \( \alpha_{0}' \in F_0' \cap a(Y) \) and \( \alpha_1' \in F_1' \cap a(Y) \), since \( a \) respects \( \epsilon \)-relation. But then, necessarily, \( \alpha_{0}' = \alpha_{0}', \alpha_1' = \alpha_1' \).

□

Lemma 1.2.5 Let \( p = \langle \langle X, Y, Z \rangle, C, \epsilon, \subseteq \rangle \) and \( p' = \langle \langle X', Y', Z' \rangle, C', \epsilon, \subseteq \rangle \) be isomorphic suitable structures (even over different cardinals) and \( a \) an isomorphism between them. Then \( a \) respects pistes, i.e. for every \( A \in X \) and \( B \in (X \cup Y) \cap A \), \( a \) maps the piste between \( A \) and \( B \) in \( p \) onto the piste between \( a(A) \) and \( a(B) \).

20
Proof. Induction on pistes length. Thus, if $B$ in $C(A)$ or if $B \in Y$ and the piste to it from $A$ involves only $C(A)$, then the isomorphism $a$ guaranties the same for the images. Suppose that the piste proceeds with splitting. Let $F_0, F_1, F$ be the first split on the way to $B$, i.e. $F \in C(A)$, the triple $F_0, F_1, F$ is of a $\Delta$-system type, $B \not\subseteq F_0$ (or, if $B \in Y$, $B \not\in F_0$) and $B \subseteq F_1$ (or $B \in F_1 \cup \{F_1\}$). By the previous lemma (Lemma 1.2.4), $a(F_0), a(F_1), a(F)$ is a triple in $X'$ of a $\Delta$-system type. $a$ is isomorphism, hence $a(F) \in C(a(A)), a(F_0) \in C(a(F_0)), a(B) \not\in a(F_0)$ (or, if $B \in Y, a(B) \not\in a(F_0)$) and $a(B) \subseteq a(F_1)$ (or $a(B) \in a(F_1) \cup \{a(F_1)\}$).

But this means that the piste from $a(A)$ to $a(A)$ goes via $a(F_1)$. Now we can apply induction to the piste from $F_1$ to $B$, since it is shorter than the original one from $A$ to $B$.

$\Box$

Lemma 1.2.6 Let $p = \langle \langle X, Y, Z \rangle, C, \varepsilon, \subseteq \rangle$ and $p' = \langle \langle X', Y', Z' \rangle, C', \varepsilon, \subseteq \rangle$ be isomorphic suitable structures (even over different cardinals), $a$ an isomorphism between them and $F_0, F_1, F \in X$ a triple of a $\Delta$-system type. Then a respects $\pi_{F_0, F_1}$, i.e. for every $A \in F_0 \cap \langle X \cup Y \rangle$ we have $a(\pi_{F_0, F_1}(A)) = \pi_{a(F_0), a(F_1)}(a(A))$.

Proof. Let $F_0, F_1, F \in X$ be a triple of a $\Delta$-system type and $A \in F_0 \cap \langle X \cup Y \rangle$. We prove the lemma by induction on the length of the piste from $F_0$ to $A$.

Suppose first that $A \in C(F_0)$ (or in case $A \in Y$ the piste to $A$ involves only $C(F_0)$). The isomorphism $a$ moves $C(F_0)$ to $C(a(F_0))$ and $C(F_1)$ to $C(a(F_1))$. By Lemma 1.2.4, the triple $a(F_0), a(F_1), a(F)$ is of a $\Delta$-system type. So, $\pi_{a(F_0), a(F_1)}$ moves $C(a(F_0))$ onto $C(a(F_1))$ respecting the inclusion relation. Then $\pi_{a(F_0), a(F_1)}(a(A))$ should an element of $C(a(F_1))$ at the same place as $a(A)$ in $C(a(F_0))$, which, in turn is at the same place as $A$ in $C(F_0)$ and $\pi_{F_0, F_1}(A)$ in $C(F_1)$. Hence

$$a(\pi_{F_0, F_1}(A)) = \pi_{a(F_0), a(F_1)}(a(A)).$$

Suppose no that $A \not\in C(F_0)$. Let $H_0, H_1, H$ be the first splitting on the way to $A$ from $F_0$. The induction applies to $H_1, A$. Hence

$$a(\pi_{H_1, H_0}(A)) = \pi_{a(H_1), a(H_0)}(a(A)).$$

Let $A' = \pi_{H_1, H_0}(A)$. Apply the induction to $F_0, A'$. Then

$$a(\pi_{F_0, F_1}(A')) = \pi_{a(F_0), a(F_1)}(a(A')).$$

Again, apply induction to $F_0, H_0$ and $F_0, H_1$. So,

$$a(\pi_{F_0, F_1}(H_0)) = \pi_{a(F_0), a(F_1)}(a(H_0)).$$

21
\[ a(\pi_{F_0,F_1}(H_1)) = \pi_{a(F_0),a(F_1)}(a(H_1)). \]

Finally,
\[ \pi_{F_0,F_1}(A) = \pi_{\pi_{F_0,F_1}(H_0),\pi_{F_0,F_1}(H_1)}(\pi_{F_0,F_1}(\pi_{H_1,H_0}(A'))). \]

Applying \(a\), we obtain
\[ a(\pi_{F_0,F_1}(A)) = \pi_{a(F_0),a(F_1)}(a(A)). \]

\[ \square \]

Note that the proofs of Lemmas 1.2.5, 1.2.6 rely only on Lemma 1.2.4 and \(?\) (also this lemma does not use \(Z\)) do not use the component of suitable structures consisting of intersections. Let us isolate a weaker notion that still will capture all the essential parts.

**Definition 1.2.7** A two sorted structure \(\langle\langle X, Y \rangle, C, \in, \subseteq \rangle\) is called *weak suitable structure* iff

1. \(X\) has a maximal under inclusion element. Denote it \(\max(X)\),
2. \(Y \subseteq \max(X)\),
3. \(C\) is a binary relation \(X\),
4. \(\langle\langle \max(X), X, C \rangle, Y \rangle \in P'\), where for every \(A \in X\) we identify \(C(A)\) with the set \(\{B \in X \mid \langle A, B \rangle \in C\}\).

The following analogs of Lemmas 1.2.5, 1.2.6 were actually proved above:

**Lemma 1.2.8** Let \(p = \langle\langle X, Y \rangle, C, \in, \subseteq \rangle\) and \(p' = \langle\langle X', Y' \rangle, C', \in, \subseteq \rangle\) be isomorphic weak suitable structures (even over different cardinals) and \(a\) an isomorphism between them. Then \(a\) respects pistes, i.e. for every \(A \in X\) and \(B \in (X \cup Y) \cap A\), \(a\) maps the piste between \(A\) and \(B\) in \(p\) onto the piste between \(a(A)\) and \(a(B)\).

**Lemma 1.2.9** Let \(p = \langle\langle X, Y \rangle, C, \in, \subseteq \rangle\) and \(p' = \langle\langle X', Y' \rangle, C', \in, \subseteq \rangle\) be isomorphic weak suitable structures (even over different cardinals), \(a\) an isomorphism between them and \(F_0, F_1, F \in X\) a triple of a \(\Delta\)-system type. Then \(a\) respects \(\pi_{F_0,F_1}\), i.e. for every \(A \in F_0 \cap (X \cup Y)\) we have \(a(\pi_{F_0,F_1}(A)) = \pi_{a(F_0),a(F_1)}(a(A))\).
Let $p = \langle \langle X, Y \rangle, C, \in, \subseteq \rangle$ be a weak suitable structure. Consider $Z = \{ t_1 \cap ... \cap t_n \mid n < \omega, t_1, ..., t_n \in X \cup Y \}$. Then $\langle X, Y, Z \rangle, C, \in, \subseteq \rangle$ is a suitable structure. Let us call it the expansion of $p$ to a suitable structure.

**Lemma 1.2.10** Suppose that $p = \langle \langle X, Y \rangle, C, \in, \subseteq \rangle$ and $p' = \langle \langle X', Y' \rangle, C', \in, \subseteq \rangle$ are isomorphic weak suitable structures (even over different cardinals). Then their expansions are isomorphic as well.

**Proof.** Let $\alpha$ be the isomorphism between $p$ and $p'$. We show that it extends to an isomorphism between the expansions. Let $Z = \{ t_1 \cap ... \cap t_n \mid n < \omega, t_1, ..., t_n \in X \cup Y \}$ and $Z' = \{ t_1 \cap ... \cap t_n \mid n < \omega, t_1, ..., t_n \in X' \cup Y' \}$. Extend $\alpha$ to a function $b$ in the obvious fashion: $b \upharpoonright \dom(\alpha) = \alpha$ and $b(t_1 \cap ... \cap t_n) = a(t_1) \cap ... \cap a(t_n)$, for any $t_1, ..., t_n \in X \cup Y$. We need to check that such defined $b$ is a function and an isomorphism.

Note first that for every $A, B \in X$, $A' \in (A \cup \{ \emptyset \}) \cap X$ and $\alpha \in Y \cap A'$ such that $A \cap B = A' \cap \alpha$ we have $a(A) \cap a(B) = a(A') \cap a(\alpha)$. Use induction on the pistes complexity from $\max(X)$ to $A, B$ as in Lemma 1.1.11. The inductive step follows since $\alpha$ preserves $\Delta$-system triples. Also, by Lemmas 1.2.8,1.2.9, $\alpha$ respects pistes and images under $\Delta$-system triples isomorphisms.

Similar, if instead of two sets we have finitely many $A_1, ..., A_n \in X$, $A' \in (A_1 \cup \{ A_1 \}) \cap X$ and $\alpha \in Y \cap A'$ such that $A_1 \cap ... \cap A_n = A' \cap \alpha$, then $a(A_1) \cap ... \cap a(A_n) = a(A') \cap a(\alpha)$. Also, the same holds if some (or actually one) of $A_i$’s is in $Y$, i.e. is an ordinal.

Now, by Lemma 1.1.12, for every $A_1, ..., A_n \in X$ there are $A' \in (A_1 \cup \{ A_1 \}) \cap X$ and $\eta \in Y \cap A'$ such that $A_1 \cap ... \cap A_n = A' \cap \eta$, or just $A_1 \cap ... \cap A_n = A'$.

An alternative proof that works for higher gaps as well proceeds as follows. Suppose that

$$A_1 \cap ... \cap A_n = B_1 \cap ... \cap B_n,$$

for some $A_1, ..., A_n, B_1, ..., B_n \in X \cup Y$. We need to show that then

$$a(A_1) \cap ... \cap a(A_n) = a(B_1) \cap ... \cap a(B_n).$$

The proof is by induction on complexity of the pistes to components of the intersections. Thus, suppose that $A_1$ has a maximal piste complexity among the components of the intersection. Consider the pistes from $\max(X)$ to $A_1$ and to $A_2$. Go to the last point until which the pistes coincide. Then, as in the proof of Lemma 1.1.11, we replace $A_1$ by $A'_1$ in $X$ and $\alpha_1 \in Y$ which are simpler than $A_1$ in the piste sense and such that

$$A_1 \cap A_2 = A'_1 \cap \alpha_1 \cap A_2.$$
Now the induction applies.

Fix \( n < \omega \). We define an analog \( \mathcal{P}'_n \) of \( \mathcal{P}' \) on the level \( n \) just replacing \( \kappa \) by \( \kappa_n^{++} \).

An assignment function \( a_n \) will be an isomorphism between a suitable generic structure of cardinality less than \( \kappa_n \) over \( \kappa \) and a suitable structure over \( \kappa_n^{++} \).

Define \( Q_{n0} \).

**Definition 1.2.11** Let \( Q_{n0} \) be the set of the triples \( \langle a, A, f \rangle \) so that:

1. \( f \) is partial function from \( \kappa^{++} \) to \( \kappa_n \) of cardinality at most \( \kappa \)
2. \( a \) is an isomorphism between a suitable generic structure 
   \( \langle \langle X, Y, Z \rangle, C, \in, \subseteq \rangle \) of cardinality less than \( \kappa_n \) and a suitable structure 
   \( \langle \langle X', Y', Z' \rangle, C', \in, \subseteq \rangle \) in \( \mathcal{P}'_n \) so that
   
   - (a) \( \max(X') \) is above every \( t \in X' \cup Y' \) in the order \( \leq E_n \) of the extender \( E_n \), (or actually, the ordinal which codes \( \max(X') \) in the fixed in advance nice coding of \( [\kappa_n^{+++}]^{<\kappa_n} \)). We need that each element of \( [\kappa_n^{+++}]^{<\kappa_n} \) is coded by a stationary many ordinals below \( \kappa_n^{+++} \).
   
   - (b) if \( t \in X' \cup Y' \) then for some \( k, 2 < k < \omega \), \( t < H(\chi^k) \), with \( \chi \) big enough fixed in advance. (Alternatively, it is possible to work with subsets of \( \kappa_n^{+++} \) only and further require it is a restriction of such model to \( \kappa_n^{+++} \).) We deal with elementary submodels of \( H(\chi^k) \), instead of those of \( H(\kappa_n^{+++}) \).

   Further passing from \( Q_{n0} \) to \( \mathcal{P} \) we will require that for every \( k < \omega \) for all but finitely many \( n \)’s the \( n \)-th image of a model \( t \in X \cup Y \) will be an elementary submodel of \( H(\chi^k) \).

   The way to compare such models \( t_1 < H(\chi^{k_1}), t_2 < H(\chi^{k_2}) \), when \( k_1 \neq k_2 \), say \( k_1 < k_2 \), will be as follows:

   move to \( H(\chi^{k_1}) \), i.e. compare \( t_1 \) with \( t_2 \cap H(\chi^{k_1}) \).

3. \( A \in E_n, \max(X') \),
4. for every ordinals \( \alpha, \beta, \gamma \) which are elements of \( Y' \) or the ordinals coding models in \( X' \) we have

\[
\alpha \geq E_n \beta \geq E_n \gamma \quad \text{implies} \\
\pi_{\alpha\gamma}^{E_n}(\rho) = \pi_{\beta\gamma}^{E_n}(\pi_{\alpha\beta}^{E_n}(\rho))
\]
for every $\rho \in \pi^\alpha_{\max(X'),\alpha}(A)$,

5. $\pi_{\max(X'),\alpha}(\nu) > \pi_{\max(X'),\beta}(\nu)$, for every $\alpha > \beta$ in $Y'$, $\nu \in A$

Define a partial order on $Q_{\kappa_0}$ as follows.

**Definition 1.2.12** Let $\langle a, A, f \rangle$ and $\langle b, B, g \rangle$ be in $Q_{\kappa_0}$. Set $\langle a, A, f \rangle \succeq_{\kappa_0} \langle b, B, g \rangle$ iff

1. $a \supseteq b$,
2. $f \supseteq g$,
3. $\pi_{\max(rng(a)),\max(rng(b))}(A) \subseteq B$,
4. $\text{dom}(f) \cap Y^b = \text{dom}(g) \cap Y^b$, where $Y^b$ is the second component (i.e. the set of ordinals) of the suitable structure on which $b$ is defined.

Note that here we do not require disjointness of the domain of $g$ and of $Y^b$, but as it will follow from the further definition of non-direct extension, the value given by $g$ will be those that eventually counts.

**Definition 1.2.13** $Q_{\kappa_1}$ consists of all partial functions $f : \kappa^{+3} \rightarrow \kappa_n$ with $|f| \leq \kappa$. If $f, g \in Q_{\kappa_1}$, then set $f \succeq_{\kappa_1} g$ iff $f \subseteq g$.

**Definition 1.2.14** Define $Q_n = Q_{\kappa_0} \cup Q_{\kappa_1}$ and $\leq_{\ast} = \leq_{\kappa_0} \cup \leq_{\kappa_1}$.

Let $p = \langle a, A, f \rangle \in Q_{\kappa_0}$ and $\nu \in A$. Set

$$p^{\downarrow} \nu = f \cup \{\langle \alpha, \pi_{\max(rng(a)),\alpha}(\nu) \mid \alpha \in \text{dom}(a) \setminus \text{dom}(f)\}.$$

Note that here $a$ contributes only the values for $\alpha$’s in $\text{dom}(a) \setminus \text{dom}(f)$ and the values on common $\alpha$’s come from $f$. Also only the ordinals in $\text{dom}(a)$ are used to produce non direct extensions, models disappear.

Now, if $p, q \in Q_n$, then we set $p \succeq_n q$ iff either $p \succeq_{n} q$ or $p \in Q_{\kappa_1}, q = \langle b, B, g \rangle \in Q_{\kappa_0}$ and for some $\nu \in B$, $p \succeq_{\kappa_1} q^{\downarrow} \nu$.

**Definition 1.2.15** The set $\mathcal{P}$ consists of all sequences $p = \langle p_n \mid n < \omega \rangle$ so that

1. for every $n < \omega$, $p_n \in Q_n$,
2. there is $\ell(p) < \omega$ such that
   - (i) for every $n < \ell(p)$, $p_n \in Q_{\kappa_1}$.

25
Proof

Lemma 1.2.16 for every\( p \in \mathcal{P} \) and \( \langle \langle B_{0c}, B_{1c}, D_{c}^\kappa \rangle, B^{1\kappa++} \rangle \in G(\mathcal{P}') \). Then

1. for every \( \alpha \in B^{1\kappa++} \) there is \( q \geq^* p \) such that \( \alpha \in \text{dom}(a_n(q)) \) for all but finitely many \( n \)'s;

2. for every \( A \in B_{1c}^{\kappa} \) there is \( q \geq^* p \) such that \( A \in \text{dom}(a_n(q)) \) for all but finitely many \( n \)'s. Moreover, if \( \langle \langle A^{0c}, A_{1c}^\kappa, C_{c}^\kappa \rangle, A^{1\kappa++} \rangle \geq \langle \langle B^{0c}, B_{1c}^\kappa, D_{c}^\kappa \rangle, B^{1\kappa++} \rangle \) witnesses a generic suitability of \( p \) and \( A \in C_{c}^\kappa(A_{0c}^\kappa) \), then the addition of \( A \) does not require adding of ordinals and the only models that probably will be added together with \( A \) are its images under \( \Delta \)-system type isomorphisms for triples in \( p \).

Proof. Pick some \( \langle \langle A_{0c}^\kappa, A_{1c}^\kappa, C_{c}^\kappa \rangle, A^{1\kappa++} \rangle \in G(\mathcal{P}') \) stronger than \( \langle \langle B_{0c}, B_{1c}^\kappa, D_{c}^\kappa \rangle, B^{1\kappa++} \rangle \) such that

1. \( \alpha \in A^{1\kappa++} \),

2. \( A \in A_{1c}^\kappa \),

3. \( \langle \langle A_{0c}^\kappa, A_{1c}^\kappa, C_{c}^\kappa \rangle, A^{1\kappa++} \rangle \) witnesses that \( \text{dom}(a_n(p)) \) is a suitable generic structure (i.e. \( \text{dom}(a_n(p)) \) and \( \langle \langle A_{0c}^\kappa, A_{1c}^\kappa, C_{c}^\kappa \rangle, A^{1\kappa++} \rangle \) satisfy 1.2.2), for every \( n, l(p) \leq n < \omega \).
Note first that it is easy to add to $p$ any $A \in C^{\kappa^+}(A_0^{\kappa^+})$ such that the maximal models of $p_n$'s belong to $A$. Just at each level $n \geq l(p)$ pick an elementary submodel of $H(\chi^{+\omega})$ of cardinality $\kappa_n^{n+1}$ which includes $\text{rng}(a_n)$ as an element. Map $A$ to such a model.

Hence it is enough to deal with $\alpha$, $A$ which are the members of the maximal model of $p$, just, if not, then we can add first $A_0^{\kappa^+}$.

We proof the lemma simultaneously for $\alpha$ and $A$ by induction on the piste distance or complexity.

Fix $n \geq l(p)$. Let $\text{dom}(a_n(p)) = \langle \langle X, Y, Z \rangle, C, \in, \subseteq \rangle$.

Suppose that the piste to $\alpha$ involves only the central line. The general case is treated similar.

Let $A_1 \in C^{\kappa^+}(\text{max}(X))$ be the least model of $C^{\kappa^+}(\text{max}(X))$ with $\alpha \in A_1$. We assume that $A_1 \in X$. Just otherwise use the induction to add it. This is possible, since the piste to $A_1$ is simpler than those to $\alpha$.

**Case 1.** $A_1$ is the least model of $C^{\kappa^+}(\text{max}(X))$.

The piste to $\alpha$ from $\text{max}(X)$ (or from $A_0^{\kappa^+}$) consists of $A_1$ alone. So, in order to add $\alpha$ we do not have to add models or other ordinals first.

Consider $\beta_1 = \min(A_1 \cap Y \setminus \alpha)$ and $\gamma_1 = \max(A_1 \cap Y \cap \alpha)$ whenever defined. Suppose that both $\beta_1$ and $\gamma_1$ are defined. If one of them or both are undefined then the argument below will be only simpler.

Let us denote $a_n(\beta_1)$ by $\beta_1^*$, $a_n(\gamma_1)$ by $\gamma_1^*$, $a_n(X)$ by $X^*$ and $a_n(A_1)$ by $A_1^*$. Let $C^*$ be the function that corresponds to $C$ in $\text{rng}(a_n)$. Then $A_1^* \in C^*(X^*)$. Also, $\beta_1^*, \gamma_1^* \in A_1^* \cap a_n^*Y$ and $\gamma_1^* < \beta_1^*$.

Assume that $A_1^*$ and $\beta_1^*$ are $k$-good, for some $k >> 2$. Pick now $M \in A_1^*$ such that

1. $M \in \beta_1^*$,
2. $|M| = \kappa_n^{1+n}+2$,
3. $M$ is $k - 1$-good,
4. $\gamma_1^* \in M$.

Now, extend $a_n$ by mapping $\alpha$ to $M$ and all the images of it under $\Delta$-system types triples isomorphisms to those of $M$.

**Case 2.** $A_1$ is not the least element of $C^{\kappa^+}(\text{max}(X))$.

Then we will need to add also the immediate predecessor $A_1^-$ of $A_1$ in $C^{\kappa^+}(\text{max}(X))$. Do this using the induction.
Split the argument into three cases.

Case 2.1. \( \alpha > \sup(A^-_1) \).

Then we proceed exactly as in Case 1 above only require in addition that \( a_n(A^-_1) \in M \).

Case 2.2. \( \alpha = \sup(A^-_1) \).

Set \( B = a_n(A_1) \). Then, its immediate predecessor \( B^- = a_n(A^-_1) \). Pick \( k < \omega \) such that \( B^- < H(\chi^{+k+1}) \) and \( B \cap H(\chi^{+k+1}) < H(\chi^{+k+1}) \). Then \( H(\chi^{+k}) \in B^- \). Hence

\[
B^- \models \forall \nu < \kappa_n^{+n+3} \exists t \in [H(\chi^{+k})]<\kappa^{+n+3} \exists M \prec H(\chi^{+k}) \ (M \supseteq \nu \cup t \text{ and } |M| < \kappa_n^{+n+3}).
\]

Let \( \delta = \sup((B^- \cap \kappa_n^{+n+3}) \cap H(\chi^{+k})) \). Set \( M \) to be the Skolem hull of \( \delta \cap (B^- \cap H(\chi^{+k})) \) in \( H(\chi^{+k}) \).

Then \( M \cap \kappa_n^{+n+3} = \delta \). Also, \( M \in B^- \).

Now, extend \( a_n \) by mapping \( \alpha \) to \( M \) and all the images of \( \alpha \) under \( \Delta \)-system types triples isomorphisms to those of \( M \).

Case 2.3. \( \alpha < \sup(A^-_1) \).

Consider \( \alpha_1 = \min(A^-_1 \setminus \alpha) \). We need to add \( \alpha_1 \) before \( \alpha \) and this can be done using the induction, since the piste to \( \alpha_1 \) is simpler than those to \( \alpha \). So assume that \( \alpha_1 \) is already in \( Y \). Note that \( \text{cof}(\alpha_1) = \kappa^+ \), since \( A^-_1 \supseteq \kappa^+ \) and it is an elementary submodel of \( H(\kappa^+) \).

We split the proof now into two cases.

Case 2.3.1. \( \alpha = \sup(\alpha_1 \cap A^-_1) \).

This case is similar to Case 2.2 above. Set \( B = a_n(A_1) \). Then, its immediate predecessor \( B^- = a_n(A^-_1) \). Let \( E = a_n(A_1) \).

Pick \( k < \omega \) such that \( E < H(\chi^{+k+1}) \), \( B^- \cap H(\chi^{+k+1}) < H(\chi^{+k+1}) \) and \( B \cap H(\chi^{+k+1}) < H(\chi^{+k+1}) \). Then \( H(\chi^{+k}) \in E \cap B^- \).

\[
E \cap B^- \models \forall \nu < \kappa_n^{+n+3} \exists t \in [H(\chi^{+k})]<\kappa^{+n+3} \exists M \prec H(\chi^{+k}) \ (M \supseteq \nu \cup t \text{ and } |M| < \kappa_n^{+n+3}).
\]

Let \( \delta = \sup((E \cap B^- \cap \kappa_n^{+n+3}) \cap H(\chi^{+k})) \). Set \( M \) to be the Skolem hull of \( \delta \cap (E \cap B^- \cap H(\chi^{+k})) \) in \( H(\chi^{+k}) \).

Then \( M \cap \kappa_n^{+n+3} = \delta \). Also, \( M \in B^- \).

Now, extend \( a_n \) by mapping \( \alpha \) to \( M \) and all the images of \( \alpha \) under \( \Delta \)-system types triples isomorphisms to those of \( M \).

Case 2.3.2. \( \alpha > \sup(\alpha_1 \cap A^-_1) \).

Consider \( \beta_1 = \min((A_1 \cap Y) \setminus \alpha) \) and \( \gamma_1 = \max(A_1 \cap Y \cap \alpha) \) whenever defined. Suppose that both \( \beta_1 \) and \( \gamma_1 \) are defined. If one of them or both are undefined then the argument below will be only simpler.

Let us denote \( a_n(\beta_1) \) by \( \beta^*_1 \), \( a_n(\gamma_1) \) by \( \gamma^*_1 \), \( a_n(X) \) by \( X^* \) and \( a_n(A_1) \) by \( A^*_1 \). Let \( C^* \) be the
function that corresponds to \( C \) in \( \text{rng}(a_n) \). Then \( A_1^* \in C^*(X^*) \) and \( a_n(A_1^*) \) is the immediate predecessor of \( A_1^* \) in \( C^*(A_1^*) \). Also, \( \beta^*, \gamma^* \in A_1^* \cap a_n"Y \) and \( \gamma^* < \beta^* \).

Assume that \( A_1^* \) and \( \beta_1^* \) are \( k \)-good, for some \( k >> 2 \). Pick now \( M \in A_1^* \) such that

1. \( M \in \beta_1^* \),
2. \( |M| = \kappa_n^{+n+2} \),
3. \( M \) is \( k-1 \)-good,
4. \( \gamma_1^*, a_n(A_1^*) \cap a_n(\alpha_1) \in M \).

Now, extend \( a_n \) by mapping \( \alpha \) to \( M \) and all the images of it under \( \Delta \)-system types triples isomorphisms to those of \( M \).

Set

\[
Y_1 = Y \cup \{ \alpha' \mid \alpha' \text{ is the image of } \alpha \text{ under } \Delta - \text{ system types triples (of } X \text{) isomorphisms} \}.
\]

**Claim 1.2.16.1** \( Y_1 \) is a closed set.

**Proof.** We just prove that every limit point of \( Y_1 \) is a limit point of \( Y \), and hence, is in \( Y \). It is enough to deal limits of \( \omega \)-sequences, since if every limit of an \( \omega \)-sequence from \( Y_1 \) is in \( Y \), then any limit will be in \( Y \), because \( Y \) is closed.

Such images are generated as follows. Pick the smallest triple \( F_0^1, F_1^1, F^1 \in X \) of a \( \Delta \)-system type with \( F_0^1, F^1 \in C(\max(X)) \) and \( F_0^1 \subseteq A \). We add \( \alpha_1 = \pi_{F_0^1, F_1^1}(\alpha) \) to \( Y \). Note that it is possible to have \( \alpha = \alpha_1 \). Let \( \xi_0^1 \in F_0^1 \cap Y, \xi_1^1 \in F_1^1 \cap Y \) be as in Definition 1.1.2(4d). Then \( \alpha_1 > \alpha \) implies \( \xi_0^1 \leq \alpha < \xi_1^1 \leq \alpha_1 \).

Then pick the smallest triple \( F_0^2, F_1^2, F^2 \in X \) of a \( \Delta \)-system type with \( F_0^2, F^2 \in C(\max(X)) \) and \( F_0^2 \subseteq F^1 \). We add \( \alpha_2^0 = \pi_{F_0^2, F_1^2}(\alpha) \) and \( \alpha_2^1 = \pi_{F_0^2, F_1^2}(\alpha_1) \) to \( Y \). Again it is possible to have \( \alpha_2^i \in \{ \alpha, \alpha_1 \} \), where \( i < 2 \). Let \( \xi_0^2 \in F_0^2 \cap Y, \xi_1^2 \in F_1^2 \cap Y \) be as in Definition 1.1.2(4d). Again, if one of the new \( \alpha_2^i \)'s is above its pre-image, then the corresponding \( \xi_i^2 \) will be above \( \sup(F_0^2) \), and so, above both \( \alpha, \alpha_1 \).

Continue further all the way up to \( \max(X) \). This way all the images of \( \alpha \) are generated. Note that we move up over the central line of \( X \).

At each stage \( j \) in the process the same effect observed above will take place- if one of \( \alpha_j^i \)'s is above its pre-image, then the corresponding \( \xi_i^j \) will be above \( \sup(F_0^j) \), and so, above all the images \( \alpha_j^{j'} \) of \( \alpha \) generated at stages \( j' < j \). But all such \( \xi_i^j \) are in \( Y \). Hence, their limit, which is the same as those of increasing sequence of \( \alpha_j^{j'} \)'s, is in \( Y \) as well.

\( \square \) of the claim.
Turn now to the adding of a model. 

Assume first that a model $A$ is on the central line. Let us observe that no collision with ordinals in $Y$ can occur. Thus if some $\alpha \in Y, \alpha \not\in A$ and $\sup(A) > \alpha$ (if $\alpha = \sup(A)$, then by the piste closure we must have $A \in X$), then the same should hold with images, i.e. the image $A^*$ of $A$ must have supremum above $\alpha^* := a_n(\alpha)$ and $\alpha^* \not\in A^*$. There may be infinitely many such $\alpha$’s and then, in general, it will be impossible to find $A^*$. In present situation, we have the advantage - $X$ is closed under pistes to ordinals. This means, in particular, that there is $B_\alpha \in C(\max(X))$ such that $\alpha \in B_\alpha$ and $B_\alpha$ is the least model of $C(\max(X))$, or $B_\alpha$ has the immediate predecessor $B_\alpha^-$ in $C(\max(X))$ and $\alpha \not\in B_\alpha^-$. In our case the first possibility is just impossible. Thus, we assumed that $A \in C_\alpha^+(A^{0<\alpha})$, $\alpha \in B_\alpha \setminus A$. So, $B_\alpha$ is not the least element of $C_\alpha^+(A^{0<\alpha})$, which by 1.2.2(3) implies that $B_\alpha$ is not the least element of $C(\max(X))$ as well.

Hence, $B_\alpha^-$ exists and $A \subseteq B_\alpha^-$. Consider now a set 

$$T = \{B_\alpha^- \mid \alpha \in Y, \alpha \not\in A, \sup(A) > \alpha\}.$$ 

$T$ is a subset of the closed chain $C(\max(X))$. Let $E$ be the least element of $T$ under the inclusion. Then $A \subset E$, since $T \subset C_\alpha^+(A^{0<\alpha})$ and so, both $E$ and $A$ are inside the chain $C_\alpha^+(A^{0<\alpha})$, but $E$ is of the form $B_{\alpha}^-$, for some $\alpha \in B_\alpha \setminus A$, and $B_{\alpha}^\alpha \in X, A \not\in X$.

Now it is easy to add $A$ in a fashion similar to adding an ordinal above. First we pick the least $D \in C(E)$ which contains $A$. Let $F$ be the last model of $C(E)$ inside $D$. Note that $D$ can be a limit model of $C_\alpha^+(A^{0<\alpha})$ and so $D^-$ may not exist. Even if $D^-$ exists, still it cannot be in $X$, since otherwise $A = D^-$ will be in $X$.

Set $\beta = \min((D \cap Y) \setminus \sup(A))$ whenever defined. Suppose that $\beta$ is defined. If it is undefined then the argument below will be only simpler. Note that necessarily $\beta > \sup(A)$. Otherwise, $\sup(A) = \beta$ and it is in $Y$. Then the largest model $W$ of $C_\alpha^+(A^{0<\alpha})$ with $\sup(A) \not\in W$ must be in $X$ (pistes closure to ordinals). But then $W = A$, since $W \not= A$ will imply $W \in A$ or $A \in W$, both possibilities are clearly impossible.

Note that every $\gamma \in D \cap Y \cap \beta$ is in $F$. Otherwise, let some $\gamma \in D \cap Y \cap \beta$ be not in $F$. The piste to $\gamma$ goes via $D$ but does continue further on $C_\alpha^+(D)$. Hence, $D$ must be a successor model of $C_\alpha^+(A^{0<\alpha})$ and $D^-$ must be in $X$, which is impossible, as was observed above.

Let us denote $a_n(\beta)$ by $\beta^*$, $a_n(D)$ by $D^*$, $a_n(X)$ by $X^*$ and $a_n(F)$ by $F^*$. Let $C^*$ be the function that corresponds to $C$ in $\operatorname{rng}(a_n)$. Then $D^*, F^* \in C^*(X^*)$ and $\beta^* \in D^* \cap a_n^*Y$.

Assume that $D^*$ and $\beta^*$ are $k$-good, for some $k >> 2$. Pick now $M \in D^*$ such that

1. $M \in \beta^*$,
2. $|M| = \kappa_n^{+n+1}$,

3. $M$ is $k-1$-good,

4. $F^* \in M$.

Now, extend $a_n$ by mapping $A$ to $M$ and all the images of it under $\Delta$-system types triples isomorphisms to those of $M$.

Note that no new ordinals were added in the process and only models that are images of $A$ under $\Delta$-system types isomorphisms for triples in $X$ were added.

Suppose that $A$ is not on the central line. In this case we are supposed to add to $p$ the whole piste from $A^{0<\kappa}$ to $A$. We can concentrate, using the induction, only on the case of a $\Delta$-system triple. Namely given $F_0, F_1, F \in A^{1<\kappa}$ of a $\Delta$-system type with $F_0$ being the immediate predecessor of $F$ in $C^{<\kappa}(A^{0<\kappa})$. We need to add $F_1$ (and probably also $F_0, F$ if they are not inside) to $p$. $F_0, F$ are on the central line, hence we may assume that they are in $p$. Let $\alpha_0, \alpha_1 \in F \cap A^{1<\kappa}$ be so that $\alpha_0 \in F_0, \alpha_1 \in F_1, F_0 \cap F_1 = \alpha_0 \cap F_0 = \alpha_1 \cap F_1$ and either $\alpha_0 > \sup(F_1)$ or $\alpha_1 > \sup(F_0)$. By the argument above, we can assume that $\alpha_0$ is already in $p$.

Note that $F_1 \not\subseteq p$ implies that $\alpha_1 \not\subseteq p$, since otherwise the piste to $\alpha_1$ must be in $p$, by the definition of a suitable structure, but $F_1$ which is a part of this piste (actually the final model of it) is not in $p$. This provides a freedom to define the image of $\alpha_1$ which will be crucial further in choosing the image of $F_1$.

Fix $n \geq l(p)$. We need to add $F_1$ to $\text{dom}(a_n(p))$. Let $\text{dom}(a_n(p)) = \langle \langle X, Y, Z \rangle, C, \in, \subseteq \rangle$.

We assume that $F_0, F \in C(\max(X))$ and $\alpha_0 \in Y$.

Note that $Y \cap [\alpha_1, \sup(F_1)] = \emptyset$, since if some $\xi \in Y \cap [\alpha_1, \sup(F_1)]$, then all models of the piste to $\xi$ are in $X$, but $F_1$ is one of them.

Split into two cases.

**Case 1.** $\alpha_0 > \alpha_1$.

Then $\sup(F_1) < \alpha_0$. Consider the images $F_0^*$, $F^*$ and $M_0$ of $F_0, F$ and $\alpha_0$ under $a_n$.

Let us deal first with a little bit simplified situation, but which still contains the main elements of the construction.

**Subcase 1.A.** No elements of $Y \cap (\sup(F_0 \cap \alpha_0), \alpha_0)$ are in $\text{dom}(a_n) \cap F$.

By Definition 1.1.2, we have $\text{cof}(\alpha_0) = \kappa^+$. Hence $\text{cof}(M_0 \cap \kappa_n^{+n+3}) = \kappa_n^{+n+2}$. So, $\kappa_n^{+n+3} > M_0 \subseteq M_0$. In particular, $M_0 \cap F_0^* \in M_0$. Clearly, $M_0 \cap F_0^* \in F^*$, as well. We assume that $M_0$ is $k$-good for $k$ big enough. Hence there is a $k-1$-good $M_1 \in M_0$ realizing the same $k-1$ type over $M_0 \cap F_0^*$ as $M_0$ does. By elementarity, we can find such $M_1$ inside $F^*$.
Finally, pick $F^*_1$ to be an element of $F^* \cap M_0$ which realizes over $\langle M_0 \cap F^*_0, M_1 \rangle$ the same $k - 1$ type as $F^*_0$ realizes over $\langle M_0 \cap F^*_0, M_0 \rangle$.

Extend $a_n$ by mapping $F_1$ to $F^*_1$ and all the images of it under $\Delta$-system types triples isomorphisms. In particular, $M_1$ is added as the image of $M_0$ under $\pi_{F^*_0,F^*_1}$.

Turn now to a general case.

**Subcase 1.B.** There are elements of $Y \cap (\sup(F_0 \cap \alpha_0), \alpha_0)$ in $\text{dom}(a_n) \cap F$.

Let $\gamma$ denotes the last such element below $\alpha_1$ and $\beta$ the first such element above $\alpha_1$. If one of them does not exists, then the argument below applies with obvious simplifications. Note that, as was observed above, there is no elements of $Y$ in the interval $[\alpha_1, \sup(F_1)]$.

Denote $a_n(\beta)$ by $N$ and $a_n(\gamma)$ by $\gamma^*$. We assume that $M_0$ and $N$ are $k$-good for $k$ big enough. $\sup(F^*_0 \cap M_0) \cap \kappa^+_n < N \cap \kappa^+_n$, hence $F^*_0 \cap M_0 \cap \kappa^+_n \in N$ (as a set of ordinals of small cardinality). There is a $k - 1$-good $M_1 \in N$ realizing the same $k - 1$ type over $F^*_0 \cap M_0 \cap \kappa^+_n$ as $M_0$ does and with $\gamma^* \in M_1$. By elementarity, we can find such $M_1$ inside $F^*$. Finally, pick $F^*_1$ to be an element of $F^* \cap N$ which realizes over $\langle F^*_0 \cap M_0 \cap \kappa^+_n, M_1 \rangle$ the same $k - 1$ type as $F^*_0$ realizes over $\langle M_0 \cap F^*_0, M_0 \rangle$.

Extend $a_n$ by mapping $F_1$ to $F^*_1$ and all the images of it under $\Delta$-system types triples isomorphisms. In particular, $M_1$ is added as the image of $M_0$ under $\pi_{F^*_0,F^*_1}$.

**Case 1.** $\alpha_0 < \alpha_1$.

The construction is similar. The only change is that we pick $M_1$ above $M_0$.

This completes the inductive construction, and hence the proof of the lemma.

The ordering $\leq^*$ on $\mathcal{P}$ and $\leq_n$ on $Q_{n0}$ seems to be not closed in the present situation. Thus it is possible to find an increasing sequence of $\aleph_0$ conditions $\langle a_i, A_{ni}, f_m \mid i < \omega \rangle$ in $Q_{n0}$ with no simple upper bound. The reason is that the union of maximal models of these conditions, i.e. $\bigcup_{i<\omega} \max(\text{dom } a_n)$ need not be in $A^{1\kappa^+}$ for any $A^{1\kappa^+}$ in $G(\mathcal{P}')$. The next lemma shows that still $\leq_n$ and so also $\leq^*$ share a kind of strategic closure.

**Lemma 1.2.17** Let $n < \omega$. Then $\langle Q_{n0}, \leq_n \rangle$ does not add new sequences of ordinals of the length $< \kappa_n$, i.e. it is $(\kappa_n, \infty)$ - distributive.

**Proof.** Let $\delta < \kappa_n$ and $\dot{h}$ be a $Q_{n0}$-name of a function from $\delta$ to ordinals. Without loss of generality assume that $\delta$ is a regular cardinal.

Using genericity of $G(\mathcal{P}')$ (or stationarity of the set $\{A^{0\kappa^+} \mid A^{0\kappa^+}$ appears in an element of $G(\mathcal{P}')\}$) it is not hard to find elementary submodel $M$ of some $H(\nu)$ for $\nu$ big enough so that

32
(a) $Q_{n0}, h, \mathcal{P}' \in M$,

(b) $|M| = \kappa^+$,

(c) there is $\langle \langle A_{0\kappa^+}, A_{1\kappa^+}, C_{\kappa^+} \rangle, A_{1\kappa^+} \rangle \in G(\mathcal{P}')$ such that $A_{0\kappa^+} = M \cap H(\kappa^+)$ and $\max(A_{1\kappa^+} \cap \kappa^+3) = \sup(M \cap \kappa^+3)$.

(d) $\text{cf}(M \cap \kappa^+) = \delta$,

(e) $\delta > M \subseteq M$.

Note that for such $M$, $M^* = M \cap H(\kappa^+)$ must be a limit model, since by Definition 1.1.1(3) successor models are closed under $\kappa$ sequences, but $M^*$ is not by (d) above.

We have $C_{\kappa^+}(M^*) \setminus \{M^*\} \subseteq M^*$. Let $B \in C_{\kappa^+}(M^*) \setminus \{M^*\}$. We claim that then $C_{\kappa^+}(B) \in M$. Thus, by elementarity there are $B_{1\kappa^+}, D_{\kappa^+}, B_{1\kappa^+}^+ \in M$ such that

\[ \langle \langle B, B_{1\kappa^+}, D_{\kappa^+} \rangle, B_{1\kappa^+}^+ \rangle \in G(\mathcal{P}') \cap M. \]

Note that $C_{\kappa^+} \upharpoonright B_{1\kappa^+}$ may be different from $D_{\kappa^+}$, but by the definition of order on $\mathcal{P}'$ (1.1.15) and since $B \in C_{\kappa^+}(M^*)$, there are $E_1, ..., E_n \in B_{1\kappa^+}$ such that the switch with $E_1, ..., E_n$ turns $D_{\kappa^+}$ into $C_{\kappa^+} \upharpoonright B_{1\kappa^+}$. But $B_{1\kappa^+} \in M$ and $|B_{1\kappa^+}| \leq \kappa^+$. Hence $B_{1\kappa^+} \subseteq M$. So $E_1, ..., E_n \in M$, and then the corresponding switch is in $M$ as well. This implies that its result $C_{\kappa^+} \upharpoonright B_{1\kappa^+}$ is in $M$.

The cofinality of $C_{\kappa^+}(M^*) \setminus \{M^*\}$ under the inclusion must be $\delta$, since it is an $\in$-increasing continuous sequence of elements of $M^*$ with limit $M^*$ and by (d) above $\text{cf}(M^* \cap \kappa^+) = \delta$.

Fix an increasing continuous sequence $\langle A_i | i < \delta \rangle$ of elements of $C_{\kappa^+}(M^*) \setminus \{M^*\}$ such that $\bigcup_{i<\delta} A_i = M^*$, $A_0$ is a successor model and for each limit model $A_i$ in the sequence $A_{i+1}$ is its immediate successor in $C_{\kappa^+}(M^*)$. By (e), each initial segment of it will be in $M$. Now we decide inside $M$ one by one values of $h$ and put models from $\langle A_i | i < \delta \rangle$ to be maximal models of conditions used. This way we insure that unions of such conditions is a condition.

We define by induction an increasing sequence of conditions

\[ \langle \langle a(i), A(i), f(i) \rangle | i \leq \delta \rangle. \]

and an increasing continuous subsequence

\[ \langle A_{k_i} | i < \delta \rangle \text{ of } \langle A_i | i < \delta \rangle \]

such that for each $i < \delta$
(1) \(\langle a(i), A(i), f(i) \rangle \in M\),

(2) \(\langle a(i + 1), A(i + 1), f(i + 1) \rangle\) decides \(\hat{h}(i)\),

(3) \(A_{k_i}, A_{k_i + 1} \in \text{dom}(a(i))\), \(A_{k_i + 1}\) is the maximal model of \(\text{dom}(a(i))\) and \(\langle \langle A_{k_i + 1}, T, C^{n^+} \upharpoonright T \rangle, R \rangle \in G(P) \cap M\) witnesses a generic suitability of \(\text{dom}(a(i))\), for some \(T, R,\) with \(R \subseteq A_{k_i + 1} \cup \text{sup}(A_{k_i + 1})\).

There is no problem with \(A(i)\)'s and \(f(i)\)'s in this construction. Thus we have enough completeness to take intersections of \(A(i)\)'s and unions of \(f(i)\)'s. The only problematic part is \(a(i)\). So let us concentrate only on building of \(a(i)\)'s.

\(i = 0\)

Then let us pick some \(Z_0 < Z_1 \prec H(\chi^+\omega) \cap M\) of cardinality \(\kappa^{n+1}_n\), closed under \(\kappa^{n}_n\)-sequences of its elements and \(Z_0 \in Z_1\). Set \(a(0) = \langle\langle A_0, Z_0\rangle, \langle A_1, Z_1\rangle\rangle\).

\(i + 1\)

Then we first extend \(\langle a(i), A(i), f(i) \rangle\) to a condition \(\langle a(i)', A(i)', f(i)' \rangle \in M\) which decides \(\hat{h}(i)\). Then perform \(\text{swt}\) (see 1.1.13) to turn \(\langle a(i)', A(i)', f(i)' \rangle\) into an equivalent condition \(\langle a(i)'', A(i)', f(i)' \rangle\) with \(A_{k_i} \in C^{n^+}\langle \text{max}(\text{dom}(a(i)'')) \rangle\). Pick a successor model \(A_j\) (from the cofinal sequence \(\langle A_i \mid i < \delta \rangle\)) including \(\max(\text{dom}(a(i)''))\). Set \(k_{i+1} = j\) and add it to \(\text{dom}(a(i)'')\), using \(\text{swt}\) inside \(A_j\) if necessary. Finally we add \(A_{j+1}\).

\(i\) is a limit ordinal

Then we need to turn \(a = \bigcup_{j < i} a(j)\) into condition. For this we will need to add to \(\text{dom}(a)\) models and ordinals which are limits of elements of \(\text{dom}(a)\). First we extend \(a\) by adding to it \(\langle A_{k_i}, \bigcup_{j < i} a(A_{k_j}) \rangle\), where \(k_i = \bigcup_{j < i} k_j\). Then for each non decreasing sequence \(\langle a_j \mid j < i \rangle\) of ordinals in \(\text{dom}(a)\) we add the pair \(\langle \bigcup_{j < i} a_j, \bigcup_{j < i} a(a_j) \cap H(\chi^+\ell)\rangle\), if it is not already in the \(\text{dom}(a)\), where \(\ell \leq \omega\) the maximal such that for unboundedly many \(j\)'s in \(i\) \(a(a_j) \prec H(\chi^+\ell)\), if the maximum exists or \(\ell \gg n\) otherwise. Finally, for each model \(B \in \text{dom}(a)\) if there is a nondecreasing sequence \(\langle B_j \mid j < i \rangle\) of elements of \(C^{n^+}(B)\) in \(\text{dom}(a)\) and \(B\) is the least possible (under inclusion or with least sup) including the sequence, then we add the pair \(\langle \bigcup_{j < i} B_j, \bigcup_{j < i} a(B_j) \cap H(\chi^+\ell)\rangle\), if it is not already in the \(\text{dom}(a)\), where \(\ell \leq \omega\) is the minimum between the least \(k\) such that \(a(B) \subseteq H(\chi^+k)\) and the maximal \(\ell'\) such that for unboundedly many \(j\)'s in \(i\) \(a(B_j) \prec H(\chi^+\ell')\), if the maximum exists

or

it is \(k\), if the maximum does not exist and \(k < \omega\),

or

34
\[ \ell \gg n, \text{ if the maximum does not exist and } k = \omega. \]

We will need to extend a bit more if the following hold:

1. \( B \in \text{dom}(a) \),

2. \( \langle B_j \mid j < i \rangle \) is a nondecreasing sequence of elements of \( C^{\kappa^+}(B) \) in \( \text{dom}(a) \),

3. \( B \) is the least element of \( \text{dom}(a) \) such that \( \bigcup_{j<i} B_j \in B \),

4. \( \langle \alpha_j \mid j < i \rangle \) is a sequence of ordinals such that
   \begin{enumerate}
   
   \item \( \alpha_j \in B_j \),
   \item \( \alpha_j \in \text{dom}(a) \),
   \item \( \bigcup_{j<i} \alpha_j \notin \text{dom}(a) \).
   \end{enumerate}

Set \( \alpha = \bigcup_{j<i} \alpha_j \). Then \( \alpha \in B \).

Let us consider two cases.

**Case 1.** \( \alpha \notin \bigcup_{j<i} B_j \).

If \( B \) is the real immediate successor of \( \bigcup_{j<i} B_j \), i.e. the one in \( C^{\kappa^+}(A^{0^\kappa^+}) \) of \( G(P') \), then the extension made above suffices. Otherwise, we need to add the real successor of \( \bigcup_{j<i} B_j \) in order to insure pistes to ordinals closure. Denote such successor by \( E \). We map it to a model \( E^* \) such that \( \bigcup_{j<i}(a(B_j) \cap H(\chi^{+\ell})) \prec E^* \prec a(B) \cap H(\chi^{+\ell}) \) and \( E^* \) is good enough, where \( \ell \) is as above. Note that each \( \gamma \in B \cap \text{dom}(a) \) is already in \( B_j \), for some \( j < i \), by pistes to ordinals closure of \( \text{dom}(a) \). Finally we map \( \alpha \) to \( \bigcup_{j<i}(a(B_j) \cap a(\alpha_j)) \).

**Case 2.** \( \alpha \in \bigcup_{j<i} B_j \).

Let \( E \) be the smallest model in \( C^{\kappa^+}(B) \) with \( \alpha \in E \).

**Subcase 2.1.** \( E \) is the least (under the inclusion) element of \( C^{\kappa^+}(B) \).

If for some \( j < i \) we have \( \alpha_j \in E \), then by the piste closure of \( \text{dom}(a) \), the model \( E \) is in \( \text{dom}(a) \). It is easy now to extend \( a \) by adding only \( \alpha \) which is mapped to an appropriate element of \( a(E) \).

Suppose that for each \( j < i \), \( \alpha_j \notin E \). Consider \( \alpha_0 \). Let \( D_0 \) be the largest model in \( C^{\kappa^+}(B) \) with \( \alpha_0 \notin D_0 \). By the piste closure of \( \text{dom}(a) \), we have \( D_0 \in \text{dom}(a) \). Assume that \( D_0 \neq E \), otherwise proceed as above. Clearly \( D_0 \supseteq E \), and hence \( \alpha_0 < \alpha < \sup(D_0) \). Then \( \alpha_{01} := \min(D_0 \cap \alpha_0) \in \text{dom}(a) \). So, \( \alpha_0 < \alpha_{01} < \alpha \). Let \( D_{01} \) be the largest model in \( C^{\kappa^+}(B) \) with \( \alpha_{01} \notin D_0 \). By the piste closure of \( \text{dom}(a) \), we have \( D_{01} \in \text{dom}(a) \). Again, we assume that \( D_{01} \neq E \). Clearly \( D_0 \supseteq D_{01} \supseteq E \), and hence \( \alpha_{01} < \alpha < \sup(D_{01}) \). Then \( \alpha_{02} := \min(D_{01} \cap \alpha_{01}) \in \text{dom}(a) \). So, \( \alpha_0 < \alpha_{01} < \alpha_{02} < \alpha \). We continue and define \( D_{02} \) etc.
Suppose that $p$ is the largest model in $C$. Then, if $\alpha$ is a limit point of $C$, the sequence of such $\alpha$ will be in the immediate successor of $C$. Let $K$ be the least model of $C$ with $\alpha$ inside, and hence it must be in dom($a$) by the piste closure of dom($a$).

Claim 1.2.17.1 There is an increasing sequence $\langle \alpha_j' \mid j < i \rangle$ in $E^- \cap \text{dom}(a)$ with limit $\alpha$.

Proof. Let $j < i$. If $\alpha_j \in E^-$, then we take it. Suppose that $\alpha_j \notin E^-$. Pick $D_j$ to be the largest model in $C^+(B)$ with $\alpha_j \notin D_j$. Then, $D_j \in \text{dom}(a)$, and clearly, $D_j \supseteq E^-$. Also, $\alpha_j < \alpha$ and $\alpha$ is a limit point of $E^-$. Hence $\alpha_j < \text{sup}(D_j)$. Then $\alpha_j := \min(D_j \setminus \alpha_j) \in D_j \cap \text{dom}(a)$. If $\alpha_j \in E^-$, then we pick it. Otherwise, continue and consider $D_{j1}$ the largest model in $C^+(B)$ with $\alpha_{j1} \notin D_{j1}$. Then, $D_{j1} \in \text{dom}(a)$, and clearly, $D_{j1} \supseteq E^-$. Also, $\alpha_{j1} < \alpha$ and $\alpha$ is a limit point of $E^-$. Hence $\alpha_{j1} < \text{sup}(D_{j1})$. Then $\alpha_{j2} := \min(D_{j1} \setminus \alpha_{j1}) \in D_{j1} \cap \text{dom}(a)$.

If $\alpha_{j2} \in E^-$, then we pick it. Otherwise, continue. After finitely many steps we will reach some such $\alpha_{jk} \in E^-$. □ of the claim.

Let $\langle \alpha_j' \mid j < i \rangle$ be given by the claim. For each $j < i$ let $K_j$ be the least model of $C^+(B)$ with $\alpha_j' \in K_j$. Then $E^- = \bigcup_{j<i} K_j$, since, clearly $E^- \supseteq \bigcup_{j<i} K_j$ and if $E^- \notin \bigcup_{j<i} K_j$, then $\alpha$ will be in the immediate successor $K \in C^+(B)$ of $\bigcup_{j<i} K_j$, but $K \subseteq E^-$ and $\alpha \notin E^-$. Now we are in situation of Case 1 with $\langle \alpha_j \mid i < j \rangle$ replaced by $\langle \alpha_j' \mid i < j \rangle$ and $\langle B_j \mid i < j \rangle$ by $\langle K_j \mid j < i \rangle$.

Suppose now that $\alpha$ is not a limit point of $E^-$. Pick $j^* < i$ such that for every $j, j^* \leq j < i$, $\text{sup}(E^- \cap a) < \alpha_j$. If for some $j, j^* \leq j < i$, $\alpha_j \in E$, then $E$ will be the least model of $C^+(B)$ with $\alpha_j$ inside, and hence $E, E^- \in \text{dom}(a)$, due to the piste closure of dom($a$). Suppose that for each $j, j^* \leq j < i$, $\alpha_j \notin E$. Fix such $j$. Pick $D_j$ to be the largest model in $C^+(B)$ with $\alpha_j \notin D_j$. Then, $D_j \in \text{dom}(a)$, and clearly, $D_j \supseteq E$. If $D_j = E$, then $E \in \text{dom}(a)$. Then, also $E^- \in \text{dom}(a)$, since $\alpha_{j1} := \min(E \setminus \alpha_j) \in E \cap \text{dom}(a)$, but $E^-$ is the largest model in $C^+(B)$ with $\alpha_{j1}$ not inside, and hence it must be in dom($a$) by the piste closure.

Suppose that $D_j \neq E$. Consider $\alpha_{j1} := \min(D_j \setminus \alpha_j) \in D_j \cap \text{dom}(a)$. Clearly, $\alpha_{j1} < \alpha$, since $E \subseteq D_j$ and $\alpha \in E$. If $\alpha_{j1} \in E$, then $E$ will be the least model of $C^+(B)$ with $\alpha_{j1}$ inside, since $\alpha_{j1} \notin E^-$. Then $E, E^- \in \text{dom}(a)$.

If $\alpha_{j1} \notin E$, then we continue and pick $D_{j1}$ to be the largest model in $C^+(B)$ with $\alpha_{j1} \notin D_{j1}$. Then, $D_{j1} \in \text{dom}(a)$, and clearly, $D_{j1} \supseteq E$. If $D_{j1} = E$, then $E \in \text{dom}(a)$. Then, also $E^- \in \text{dom}(a)$, since $\alpha_{j2} := \min(E \setminus \alpha_{j1}) \in E \cap \text{dom}(a)$, but $E^-$ is the largest model in
$C^{\alpha^{+}}(B)$ with $\alpha_{j_{2}}$ not inside, and hence it must be in $\text{dom}(a)$ by the piste closure. If $D_{j_{1}} \neq E$, then we continue in the same fashion to define $\alpha_{j_{2}}, D_{j_{2}}$ etc. After finitely many steps we will have $E = D_{j_{k}}$ or $\alpha_{j_{k}} \in E$. Both imply $E, E^{-} \in \text{dom}(a)$.

Finally denote the resulting extension of $a$ by $b$.

**Claim 1.2.17.2**  \textit{dom}(b) is a suitable generic structure.

**Proof.** Let as check the condition (6(6c)) of Definition 1.1.1. Thus let $A, \alpha \in \text{dom}(b)$, $A \in C(\text{max}(\text{dom}(b)))$ a non-limit model and $\text{sup}(A) > \alpha$. We need to show that $\text{min}(A \setminus \alpha) \in \text{dom}(b)$.

**Case 1.** $A \in \text{dom}(a(l))$ for some $l < i$.

If $\alpha \in \text{dom}(a(l))$, then for some $j < i$ big enough we will have $A, \alpha \in \text{dom}(a_{j})$, and then $\text{min}(A \setminus \alpha) \in \text{dom}(a_{j})$. Note that if $\alpha$ is a non-limit element of $\text{dom}(b)$, then $\alpha \in \text{dom}(a)$.

Suppose that $\alpha$ is a limit point of $\text{dom}(b)$ and $\alpha \not\in \text{dom}(a)$. Let $\langle \alpha_{j} | j < i \rangle$ be a nondecreasing sequence from $\text{dom}(a)$ converging to $\alpha$. By (6(6c)) of Definition 1.1.1, $\gamma_{j} = \text{min}(A \setminus \alpha_{j}) \in \text{dom}(a)$. If $\langle \gamma_{j} | j < i \rangle$ is eventually constant, then the constant value will be as desired. Suppose otherwise. Then $\langle \gamma_{j} | j < i \rangle$ will be also a converging to $\alpha$ sequence. But remember that $A$ is non-limit, hence $^{*}A \subseteq A$, and so $\alpha \in A$. Then $\text{min}(A \setminus \alpha) = \alpha \in \text{dom}(b)$ and we are done.

**Case 2.** $A \not\in \text{dom}(a)$.

Assume that $\alpha \not\in A$, just otherwise $\text{min}(A \setminus \alpha) = \alpha$ and we are done. Denote $\text{min}(A \setminus \alpha)$ by $\alpha^{*}$.

**Subcase 2.1.** $\alpha \in \text{dom}(a)$.

Consider then the smallest model $E_{\alpha}$ in $C(\text{max}(\text{dom}(b)))$ with $\alpha$ inside. Let $E_{\alpha}^{-}$ be its immediate predecessor in $C(\text{max}(\text{dom}(b)))$. Then $A \subseteq E_{\alpha}^{-}$, since $\alpha \not\in A$, and $A \neq E_{\alpha}^{-}$, since $E_{\alpha}^{-} \in \text{dom}(a)$ and $A \not\in \text{dom}(a)$. Then $\text{sup}(E_{\alpha}^{-}) > \alpha$, hence $\alpha_{1} := \text{min}(E_{\alpha}^{-} \setminus \alpha) > \alpha$ and $\alpha_{1} \in \text{dom}(a)$. $E_{\alpha}^{-} \supseteq A$ implies that $\alpha_{1} \leq \alpha^{*}$. If $\alpha_{1} = \alpha^{*}$, then $\alpha^{*} \in \text{dom}(a)$ and we are done. Suppose otherwise. Then $\alpha_{1} < \alpha^{*}$. Consider then the smallest model $E_{\alpha_{1}}$ in $C(\text{max}(\text{dom}(b)))$ with $\alpha_{1}$ inside. Let $E_{\alpha_{1}}^{-}$ be its immediate predecessor in $C(\text{max}(\text{dom}(b)))$. Then $A \subseteq E_{\alpha_{1}}^{-}$, since $\alpha_{1} \not\in A$, and $A \neq E_{\alpha_{1}}^{-}$, since $E_{\alpha_{1}}^{-} \in \text{dom}(a)$ and $A \not\in \text{dom}(a)$. Then $\text{sup}(E_{\alpha_{1}}^{-}) > \alpha_{1}$, since $\alpha^{*} \in E_{\alpha_{1}}^{-}$ and $\alpha^{*} > \alpha_{1}$. Hence $\alpha_{2} := \text{min}(E_{\alpha_{1}}^{-} \setminus \alpha_{1}) > \alpha_{1}$ and $\alpha_{2} \in \text{dom}(a)$. If $\alpha_{2} = \alpha^{*}$, then $\alpha^{*} \in \text{dom}(a)$ and we are done. Otherwise, $\alpha_{2} < \alpha^{*}$. We continue and consider $E_{\alpha_{2}}, E_{\alpha_{2}}^{-}$ etc. Note that the sequence of models $E_{\alpha_{m}}$ constructed this way is decreasing. So the process stops after finitely many steps. Which means that $\alpha^{*} \in \text{dom}(a)$.

**Subcase 2.2.** $\alpha \not\in \text{dom}(a)$.

Then $\alpha$ is a limit of an increasing sequence $\langle \alpha_{j} | j < i \rangle$ of elements of $\text{dom}(a)$.
If an unbounded subsequence of the sequence \( \langle \alpha_j \mid j < i \rangle \) is in \( A \), then \( \alpha \) will be in \( A \) as well, since \( A \) is a non-limit model and so is closed under \( \delta \) sequences of its elements. Hence there is \( j^* < i \) such that for every \( j, j^* \leq j < i, \alpha_j \notin A \). Let \( j^* \leq j < i \). We have \( \sup(A) > \alpha > \alpha_j \). Set \( \alpha_j^* = \min(A \setminus \alpha_j) \). By Subcase 2.1, \( \alpha_j^* \in \text{dom}(a) \). If \( \alpha_j^* > \alpha \), then \( \alpha_j^* = \alpha^* \) and we are done. Assume, hence that \( \alpha_j^* < \alpha \), for every \( j < i \). But the sequence \( \langle \alpha_j^* \mid j < i \rangle \) is a sequence of elements of \( A \) which converges to \( \alpha \). So, \( \alpha \in A \). Contradiction.

\( \Box \) of the claim.

The next claim is similar.

**Claim 1.2.17.3** \( \text{rng}(b) \) is a suitable structure over \( \kappa_n \).

We need to check that \( b \) is an isomorphism between the suitable structures \( \text{dom}(b) \) and \( \text{rng}(b) \). By Lemma 1.2.10, it is enough to show that the restriction of \( b \) is an isomorphism between between the corresponding weak suitable structures. But this is obvious, since no \( \Delta \)-system type triples are added at limit stages.

\( \Box \)

It is possible to work in \( V \) rather than in \( V[G(P')] \) or \( M \). Combining arguments of 1.1.19 and the previous lemma it is not hard to show the following:

**Lemma 1.2.18** \( P' * Q_{n0} \) is \( \kappa_n \)-strategically closed.

**Lemma 1.2.19** \( \langle P, \leq^* \rangle \) does not add new sequences of ordinals of the length \( < \kappa_0 \).

**Proof.** Repeat the argument of Lemma 1.2.17 with \( P \) replacing \( Q_{n0} \).

\( \Box \)

The argument of Lemma 1.2.17 can be used in a standard fashion to show the Prikry condition (i.e. the standard argument runs inside elementary submodel \( M \) with \( \delta \) replaced by \( \kappa^+ \)).

**Lemma 1.2.20** \( \langle P, \leq^* \rangle \) satisfies the Prikry condition.

Finally we define \( \rightarrow \) on \( P \) similar to those of [1] or [3].

**Lemma 1.2.21** \( \langle P, \rightarrow \rangle \) satisfies \( \kappa^{++} \)-c.c.

**Proof.** Suppose otherwise. Work in \( V \). Let \( \langle p_\alpha \mid \alpha < \kappa^{++} \rangle \) be a name of an antichain of the length \( \kappa^{++} \). Using 1.1.19 we find an increasing sequence \( \langle \langle \langle A_{\alpha}^{0\kappa^+}, A_{\alpha}^{1\kappa^+}, C_{\alpha}^{\kappa^+} \rangle, A_{\alpha}^{1\kappa^{++}} \rangle \mid \alpha < \kappa^{++} \rangle \) of elements of \( P' \) and a sequence \( \langle p_\alpha \mid \alpha < \kappa^{++} \rangle \) so that for every \( \alpha < \kappa^{++} \) the following hold:
(a) \( \langle A^{0\kappa_{\alpha}}_{\alpha+1}, A^{1\kappa_{\alpha}}_{\alpha+1}, C^{\kappa_{\alpha}}_{\alpha+1}, A^{1\kappa_{\alpha+1}}_{\alpha+1} \rangle \models p_{\alpha} \leq \tilde{p}_{\alpha} \),

(b) \( \bigcup_{\beta<\alpha} A^{0\kappa_{\beta}}_{\beta} = A^{0\kappa_{\alpha}}_{\alpha} \), if \( \alpha \) is a limit ordinal,

(c) \( \alpha A^{0\kappa_{\alpha+1}}_{\alpha+1} \subseteq A^{0\kappa_{\alpha+1}}_{\alpha+1} \),

(d) \( A^{0\kappa_{\alpha+1}}_{\alpha+1} \) is a successor model,

(e) \( \langle A^{\kappa_{\beta}}_{\beta} \mid \beta < \alpha \rangle \in A^{0\kappa_{\alpha+1}}_{\alpha+1} \),

(f) for every \( \alpha \leq \beta < \kappa^{++} \) we have

\[
C^{\kappa_{\alpha}}_{\alpha} (A^{0\kappa_{\alpha}}_{\alpha}) \text{ is an initial segment of } C^{\kappa_{\beta}}_{\beta} (A^{0\kappa_{\beta}}_{\beta}),
\]

(g) \( p_{\alpha} = \langle p_{\alpha n} \mid n < \omega \rangle \),

(h) for every \( n \geq l(p_{\alpha}) \), \( A^{0\kappa_{\alpha+1}}_{\alpha+1} \) is the maximal model of \( \text{dom}(a_{\alpha n}) \) and \( A^{0\kappa_{\alpha+1}}_{\alpha} \in \text{dom}(a_{\alpha n}) \),

where \( p_{\alpha n} = \langle a_{\alpha n}, A_{\alpha}, f_{\alpha n} \rangle \).

Actually this condition is the reason for not requiring the equality in (a) above.

Let \( p_{\alpha n} = \langle a_{\alpha n}, A_{\alpha}, f_{\alpha n} \rangle \) for every \( \alpha < \kappa^{++} \) and \( n \geq l(p_{\alpha}) \).

Let \( \alpha < \kappa^{++} \). Fix some

\[
\langle \langle B^{0\kappa_{\alpha+1}}_{\alpha+1}, B^{1\kappa_{\alpha+1}}_{\alpha+1}, D^{\kappa_{\alpha+1}}_{\alpha+1}, B^{1\kappa_{\alpha+1}}_{\alpha+1} \rangle \leq P' \langle \langle A^{0\kappa_{\alpha+1}}_{\alpha+1}, A^{1\kappa_{\alpha+1}}_{\alpha+1}, C^{\kappa_{\alpha+1}}_{\alpha+1}, A^{1\kappa_{\alpha+1}}_{\alpha+1} \rangle \rangle
\]

which witnesses a generic suitability of structure \( \text{dom}(a_{\alpha n}) \) for each \( n, l(p_{\alpha}) \leq n < \omega \), as in Definition 1.2.2. Note that \( B^{0\kappa_{\alpha+1}}_{\alpha+1} \) need not be in \( C^{\kappa_{\alpha+1}}_{\alpha+1} (A^{0\kappa_{\alpha+1}}_{\alpha+1}) \) and even if it does, then \( D^{\kappa_{\alpha+1}}_{\alpha+1} (B^{0\kappa_{\alpha+1}}_{\alpha+1}) \) need not be an initial segment of \( C^{\kappa_{\alpha+1}}_{\alpha+1} (A^{0\kappa_{\alpha+1}}_{\alpha+1}) \). By the definition of the order \( \leq P' \) (Definition 1.1.15) there are \( m < \omega \) and \( E_{1}, ..., E_{m} \in A^{1\kappa_{\alpha+1}}_{\alpha+1} \) such that

\[
\text{swt}(\langle \langle A^{0\kappa_{\alpha+1}}_{\alpha+1}, A^{1\kappa_{\alpha+1}}_{\alpha+1}, C^{\kappa_{\alpha+1}}_{\alpha+1}, A^{1\kappa_{\alpha+1}}_{\alpha+1} \rangle, E_{1}, ..., E_{m} \rangle) \text{ and } \langle \langle B^{0\kappa_{\alpha+1}}_{\alpha+1}, B^{1\kappa_{\alpha+1}}_{\alpha+1}, D^{\kappa_{\alpha+1}}_{\alpha+1}, B^{1\kappa_{\alpha+1}}_{\alpha+1} \rangle \rangle
\]

satisfy (1)-(3) of Definition 1.1.15.

By Lemma 1.2.16 it is possible to add all \( E_{i}(i = 1, ..., m) \) to \( \text{dom}(a_{\alpha n}) \), for a final segment of \( n \)'s. By adding and taking non-direct extension if necessary, we can assume that \( E_{i}'s \) are already in \( \text{dom}(a_{\alpha n}) \), for every \( n \geq l(p_{\alpha}) \).

Now we can apply the opposite switch (i.e. the one starting with \( E_{m} \), then \( E_{m-1}, ..., \) and finally \( E_{1} \)) to \( \text{dom}(a_{\alpha n}) \) (and the corresponding to it under \( a_{\alpha n} \) to \( \text{rng}(a_{\alpha n}) \)). Denote the result still by \( a_{\alpha n} \).

Finally, \( \langle \langle A^{0\kappa_{\alpha+1}}_{\alpha+1}, A^{1\kappa_{\alpha+1}}_{\alpha+1}, C^{\kappa_{\alpha+1}}_{\alpha+1}, A^{1\kappa_{\alpha+1}}_{\alpha+1} \rangle \rangle \) will witness a generic suitability of structure \( \text{dom}(a_{\alpha n}) \).
for each \( n, l(p_\alpha) \leq n < \omega \).

In particular, we have now that the central line of \( \text{dom}(a_{\alpha n}) \) is a part of \( C_{\alpha+1}^\kappa(A_{\alpha+1}^0) \) and \( A_{\alpha}^{0_\kappa} \) is on it; for every \( n, l(p_\alpha) \leq n < \omega \).

Shrinking if necessary, we assume that for all \( \alpha, \beta < \kappa^+ \) the following holds:

1. \( \ell = \ell(p_\alpha) = \ell(p_\beta) \),
2. for every \( n < \ell \) \( p_{\alpha n} \) and \( p_{\beta n} \) are compatible in \( Q_{n1} \) i.e. \( p_{\alpha n} \cup p_{\beta n} \) is a function,
3. for every \( n, \ell \leq n < \omega \), \( \langle \text{dom}(f_{\alpha n}) \mid \alpha < \kappa^{++} \rangle \) form a \( \Delta \)-system with the kernel contained in \( A_{\alpha}^{0_\kappa} \),
4. for every \( n, \omega > n \geq \ell \), \( \text{rng}(a_{\alpha n}) = \text{rng}(a_{\beta n}) \).

Shrink now to the set \( S \) consisting of all the ordinals below \( \kappa^{++} \) of cofinality \( \kappa^+ \). Let \( \alpha \) be in \( S \). For each \( n, \ell \leq n < \omega \), there will be \( \beta(\alpha, n) < \alpha \) such that

\[
\text{dom}(a_{\alpha n}) \cap A_{\alpha}^{0_\kappa} \subseteq A_{\beta(\alpha, n)}^{0_\kappa}.
\]

Just recall that \( |a_{\alpha n}| < \kappa_n \). Shrink \( S \) to a stationary subset \( S^* \) so that for some \( \alpha^* < \min S^* \) of cofinality \( \kappa^+ \) we will have \( \beta(\alpha, n) < \alpha^* \), whenever \( \alpha \in S^*, \ell \leq n < \omega \). Now, the cardinality of \( A_{\alpha^*}^{0_\kappa} \) is \( \kappa^+ \). Hence, shrinking \( S^* \) if necessary, we can assume that for each \( \alpha, \beta \in S^*, \ell \leq n < \omega \)

\[
\text{dom}(a_{\alpha n}) \cap A_{\alpha}^{0_\kappa} = \text{dom}(a_{\beta n}) \cap A_{\beta}^{0_\kappa}.
\]

Let us add \( A_{\alpha^*}^{0_\kappa} \) to each \( p_\alpha \) with \( \alpha \in S^* \).

By 1.2.16(2), we can add it without adding ordinals and the only other models that probably were added are the images of \( A_{\alpha^*}^{0_\kappa} \) under \( \Delta \)-system type isomorphisms. Denote the result for simplicity by \( p_\alpha \) as well.

Let now \( \beta < \alpha \) be ordinals in \( S^* \). We claim that \( p_\beta \) and \( p_\alpha \) are compatible in \( \langle \mathcal{P}, \rightarrow \rangle \).

First extend \( p_\alpha \) by adding \( A_{\beta^*}^{0_\kappa} \). This will not add other additional models or ordinals except the images of \( A_{\beta^*}^{0_\kappa} \) under isomorphisms to \( p_\alpha \), as was remarked above.

Let \( p \) be the resulting extension. Denote \( p_\beta \) by \( q \). Assume that \( \ell(q) = \ell(p) \). Otherwise just extend \( q \) in an appropriate manner to achieve this. Let \( n \geq \ell(p) \) and \( p_n = \langle a_n, A_n, f_n \rangle \). Let \( q_n = \langle b_n, B_n, g_n \rangle \). Without loss of generality we may assume that \( a_n(A_{\beta^*}^{0_\kappa}) \) is an elementary submodel of \( \mathfrak{A}_{n,k_n} \) with \( k_n \geq 5 \). Just increase \( n \) if necessary. Now, we can realize the \( k_n - 1 \)-type of \( \text{rng}(b_n) \) inside \( a_n(A_{\beta^*}^{0_\kappa}) \) over the common parts \( \text{dom}(b_n) \) and \( \text{dom}(a_n) \). This will produce \( q'_n = \langle b'_n, B_n, g_n \rangle \) which is \( k_n - 1 \)-equivalent to \( q_n \) and with \( \text{rng}(b'_n) \subseteq a_n(A_{\beta^*}^{0_\kappa}) \).
Doing the above for all \( n \geq \ell(p) \) we will obtain \( q' = \langle q'_n \mid n < \omega \rangle \) equivalent to \( q \) (i.e. \( q' \leftarrow q \)).

Extend \( q' \) to \( q'' \) by adding to it \( \langle A^{0\kappa^+}_n, a_n(A^{0\kappa^+}_n) \rangle \) as the maximal set for every \( n \geq \ell(p) \). Recall that \( A^{0\kappa^+}_n \) was its maximal model. So we add a top model. Hence no additional models or ordinals are added at all. Let \( q''_n = \langle b''_n, B_n, g_n \rangle \), for every \( n \geq \ell(p) \).

Combine now \( p \) and \( q'' \) together. Thus for each \( n \geq \ell(p) \) we add \( b''_n \) to \( a_n \) as well as all of its isomorphic images under \( \Delta \)-system type isomorphisms of triples in \( a_n \). The rest of the parts are combined in the obvious fashion (we put together the functions and intersect sets of measure one moving first to the same measure). Add if necessary \( A^{0\kappa^+}_{\alpha+3} \) as a new top model in order to insure 1.2.11(2(2a)). Let \( r = \langle r_n \mid n < \omega \rangle \) be the result, where \( r_n = \langle c_n, C_n, h_n \rangle \), for \( n \geq \ell(p) \).

Claim 1.2.21.1 For each \( \gamma, \alpha + 3 < \gamma < \kappa^{++} \),

\[
\langle \langle A^{0\kappa^+}_\gamma, A^{1\kappa^+}_\gamma, C^{\kappa^+}_\gamma, A^{1\kappa^+}_\gamma \rangle \rangle \models r \in \mathcal{P}.
\]

Proof. Let \( \gamma \in (\alpha+3, \kappa^{++}) \) and \( G(\mathcal{P}') \) be a generic subset of \( \mathcal{P}' \) with \( \langle \langle A^{0\kappa^+}_\gamma, A^{1\kappa^+}_\gamma, C^{\kappa^+}_\gamma, A^{1\kappa^+}_\gamma \rangle \rangle \in G(\mathcal{P}') \).

Fix \( n \geq \ell(p) \). The main points here are that \( b''_n \) and \( a_n \) agree on the common part and adding of \( b''_n \) to \( a_n \) does not required other additions of models or of ordinals except the images of \( b''_n \) under \( \Delta \)-system type isomorphisms for triples in \( a_n \).

We need to check that dom(\( c_n \)) is a suitable generic structure and rng(\( a_n \)) is a suitable structure. Let us deal with dom(\( c_n \)). The range is similar. By Lemma 1.2.10 it is enough to deal with a weak suitable structures. Let \( \langle \langle X, Y, C, \in, \subseteq \rangle \rangle \) be the corresponding redact of dom(\( c_n \)).

Clearly, \( \langle \langle X, Y, C, \in, \subseteq \rangle \rangle \) is a submodel of \( \langle \langle A^{1\kappa^+}_\gamma, A^{1\kappa^+}_\gamma, C^{\kappa^+}_\gamma, \in, \subseteq \rangle \rangle \).

Let us check that the structures \( \langle \langle X, Y, C, \in, \subseteq \rangle \rangle \) and \( \langle \langle A^{1\kappa^+}_\gamma, A^{1\kappa^+}_\gamma, C^{\kappa^+}_\gamma, \in, \subseteq \rangle \rangle \) agree about pistes to members of \( X \) and to ordinals in \( Y \). This will show, in particular that \( \langle \langle X, Y, C, \in, \subseteq \rangle \rangle \) is pistes closed and, hence \( \langle \langle \text{max}(X), X, C, Y \rangle \rangle \in \mathcal{P}' \).

Fix \( t \in X \cup Y \) (a model or an ordinal). Note that, by the choice of the top model max(X) of \( X \) we have max(\( X \)) \( \in C^{\kappa^+}(A^{0\kappa^+}_\gamma) \). Hence, the piste from \( A^{0\kappa^+}_\gamma \) to \( t \) will go via max(\( X \)). If \( t \) appears in dom(\( a_n \)), then the continuation of the piste will be inside dom(\( a_n \)), since max(\( a_n \)) = \( A^{0\kappa^+}_{\alpha+1} \in C(\text{max}(X)) \). It will co-inside with the piste from \( A^{0\kappa^+}_{\alpha+1} \) to \( t \), since dom(\( a_n \)) is a suitable structure. Hence all the members of the piste are in \( X \cup Y \).
Note that if \( t \) is in the common part, i.e. if \( t \) appears in both \( \text{dom}(a_n) \) and \( \text{dom}(b_n) \), then \( t \in A^{\alpha^+}_0 \). So the piste to \( t \) passes through \( A^{\alpha^+}_0 \), since \( A^{\alpha^+}_0 \in C^{\alpha^+}(A^{\gamma^+}) \).

If \( t \) appears in \( \text{dom}(b_n'' = \text{dom}(b_n) \cup \{A^{\alpha^+}_{\beta + 2}\}) \), then the piste to \( t \) will proceed via \( A^{\alpha^+}_{\beta + 2} \), since \( t \in A^{\alpha^+}_{\beta + 2} \) and \( A^{\alpha^+}_{\beta + 2} \in C(\max(X)) \). Now, it will co-inside with the piste from \( A^{\alpha^+}_{\beta + 1} \) to \( t \), since \( \text{dom}(b_n) \) is a suitable structure and \( A^{\alpha^+}_{\beta + 1} \in C(A^{\alpha^+}_{\beta + 2}) \).

The agreement between the pistes follows.

\( \square \) of the claim.

Now we have \( r \geq p, q'' \). Hence, \( p \to r \) and \( q \to r \). Contradiction.

\( \square \)
Chapter 2

Gaps 4 and above-more symmetry.

It is a slightly changed version of [9] which allows more symmetry in the following sense: for any two isomorphic models $A, B \in A^{1,\eta}$ from a generic $G \subseteq \mathcal{P}'$ the structure of models from $G$ of cardinalities smaller than $\eta$ in $A$ is the same as those in $B$, i.e. $\pi_{A,B}[E] \in G \cap B$ whenever $E \in G \cap A$ of cardinality $< \eta$.

This symmetry makes the forcing $\mathcal{P}_{<\eta}'$ equivalent to $N_2 \cap \mathcal{P}_{<\eta}'$, see [9],1.23,1.24.

2.1 One difference between gap 3 and higher gaps

Let $\mathcal{P}'(3)$ denotes the preparation forcing for the gap 3 defined in the previous chapter. Let $G$ be a generic subset of $\mathcal{P}'(3)$. Consider

$$S = \{ A \mid \exists \langle \langle A^{0c+}, A^{1\kappa+}, C^{\kappa+} \rangle, A^{1\kappa+++} \rangle \in G \ A = A^{0c+} \}.$$ 

It was shown that $S$ is a stationary subset of $[H(\kappa^+) \leq \kappa^+]$. Let us point out in addition the following:

**Proposition 2.1.1** If $A, B \in S$ and $\text{otp}(A \cap \kappa^+) = \text{otp}(B \cap \kappa^+)$, then $A$ and $B$ are isomorphic by an isomorphism which is an identity over $A \cap B$.

**Proof.** Induction on pistes complexity.

□

The purpose of this note will be to show that this proposition fails already in the gap 4 case.

**Theorem 2.1.2** Let $\lambda < \mu$ be cardinals such that

1. $\mu$ is regular,
2. \( \lambda^{++} < \mu \),

3. \( 2^\lambda = \lambda^+ \),

4. for every \( \delta, \lambda^+ < \delta < \mu \), \( \delta^{\lambda^+} = \delta \).

Suppose that \( S \) is an unbounded subset of \( [H(\mu)]^\lambda \).
Then there are \( A, B \in S \) with \( \text{otp}(A \cap \mu) = \text{otp}(B \cap \mu) \), but the isomorphism between \( A \cap \mu \) and \( B \cap \mu \) is not the identity on \( A \cap B \cap \mu \).

Proof. Suppose otherwise. Let \( S \) be an unbounded subset of \( [H(\mu)]^\lambda \) witnessing this.
Consider a sequence \( \langle M_\alpha | \alpha < \mu \rangle \) such that for every \( \alpha < \mu \)

1. \( \langle M_\alpha, \in, <, M_\alpha \cap S \rangle \prec \langle H(\mu), \in, <, S \rangle \),

2. \( |M_\alpha| = \lambda^+ \),

3. \( M_\alpha \supseteq \lambda^+ \),

4. \( \lambda M_\alpha \subseteq M_\alpha \),

5. \( \beta \neq \alpha \) implies \( M_\beta \neq M_\alpha \).

Form a \( \Delta \)-system and shrink the sequence \( \langle M_\alpha | \alpha < \mu \rangle \) to a sequence \( \langle M_\alpha | \alpha \in Z \rangle \) such that for every \( \alpha, \beta \in Z, \alpha < \beta \) the following hold:

1. \( M_\alpha \cap \alpha = M_\beta \cap \beta \),

2. \( \sup(M_\alpha \cap \mu) < \beta \),

3. \( \langle M_\alpha, \in, <, M_\alpha \cap S \rangle \simeq \langle M_\beta, \in, <, M_\beta \cap S \rangle \) and the isomorphism is the identity on the common part.

Fix some \( \alpha \neq \beta \) in \( Z \). Pick an ordinal \( \tau \in M_\alpha \) above \( \sup(M_\alpha \cap M_\beta \cap \mu) \).

Now we use unboundedness \( S \) and find \( A \in S \) with \( \tau, \pi_{M_\alpha, M_\beta}(\tau) \in A \).
Consider \( A \cap M_\alpha \). This set belongs to \( M_\alpha \), since \( M_\alpha \) is closed under \( \lambda \)-sequences of its elements. By elementarity it is possible to find \( A_\alpha \in M_\alpha \) such that

- \( A_\alpha \supseteq M_\alpha \cap A \),

- \( \text{otp}(A_\alpha \cap \mu) = \text{otp}(A \cap \mu) \),
• $A_\alpha \in S$.

Set $A_\beta = \pi_{M_\alpha, M_\beta}(A_\alpha)$. Then $\otp(A_\alpha \cap \mu) = \otp(A_\beta \cap \mu)$ and $A_\beta \in S$, by (3) above. Note also that the isomorphism $\pi_{A_\alpha, A_\beta}$ is just $\pi_{M_\alpha, M_\beta}(A_\alpha) \upharpoonright A_\alpha$. By (1) above and the choice of $\tau$ we have $A_\alpha \cap A_\beta \cap \mu \subseteq A_\alpha \cap \tau$. Hence $\tau' := \pi_{A_\alpha, A_\beta}(\tau) \neq \tau$. But $\pi_{A_\alpha, A_\beta}(\tau) = \pi_{M_\alpha, M_\beta}(\tau)$ and the last component is in $A$. So, $\tau' \in A \cap A_\beta$.

Now,

$$\pi_{A, A_\alpha}(\tau) = \pi_{A_\alpha, A_\beta}(\pi_{A, A_\beta}(\tau)),$$

But $\tau \in A \cap A_\alpha$, $A, A_\alpha \in S$, so $\pi_{A, A_\alpha}(\tau) = \tau$. Then

$$\pi_{A, A_\beta}(\tau) = \pi_{A_\alpha, A_\beta}(\tau) = \tau'.$$

Which is impossible, since $\tau' \in A \cap A_\beta$ and $\tau \neq \tau'$.

\[\square\]

Without GCH type assumptions the theorem above consistently fails. Thus one can use a ”baby” version of the arbitrary gap preparation forcing $\mathcal{P}'$ which will be defined in the next section:

$$\langle \langle A^{0r}, A^{1r} \rangle \mid \tau \in s \rangle,$$

with only requirement that models of the same order type are isomorphic over their intersection.

We do not know if for the gap 3 always there is $S$ as in Proposition 2.1.1 (or even only unbounded set like this). Our conjecture is that it should not be the case. On the other hand in $L$-like models it may exist due to morass structures inside.

Note also that once we have such $S$, then it is quite hard to eliminate it. Cardinals should be collapsed or change their cofinality.

Carmi Merimovich asked the following question:

Suppose $N_1, N_2 \prec \langle H(\omega_2), \in, < \rangle$ are countable and $\otp(N_1 \cap \omega_2) = \otp(N_2 \cap \omega_2)$. Does it necessarily imply that $N_1 \cong N_2$?

The following provides a rather complete answer.

**Proposition 2.1.3** Suppose that $V = L$, $N_1, N_2 \prec \langle H(\omega_2), \in, < \rangle$ are countable and $\otp(N_1 \cap \omega_2) = \otp(N_2 \cap \omega_2)$. Then $N_1 \cong N_2$.

**Proof.** By Condensation Lemma, both $N_1$ and $N_2$ are isomorphic to $L_\alpha$, where $\alpha = \otp(N_1 \cap \omega_2) = \otp(N_2 \cap \omega_2)$.

\[\square\]
Proposition 2.1.4 Suppose that $2^{\aleph_0} > \aleph_1$, $N_1, N_2 < \langle H(\omega_2), \in, < \rangle$ are countable, $\text{otp}(N_1 \cap \omega_2) = \text{otp}(N_2 \cap \omega_2)$, but $N_1 \cap \omega_2 \neq N_2 \cap \omega_2$. Then $N_1 \not\preceq N_2$.

Proof. We have $N_1 \cap \omega_2 \neq N_2 \cap \omega_2$ and $2^{\aleph_0} \geq \aleph_2$, hence there is a real $r$ in $N_1 \setminus N_2$. Now if $N_1 \cong N_2$, then the isomorphism function $\pi_{N_1,N_2}$ is the identity on $\omega$. In particular $\pi_{N_1,N_2}(r) = r$. Contradiction.

The same conclusion can be derived even under GCH.

Proposition 2.1.5 Assume GCH. Suppose that $N_1, N_2 < \langle H(\omega_2), \in, < \rangle$ be countable isomorphic structures such that $\min((N_2 \cap \omega_2) \setminus (N_1 \cap \omega_2)) > \sup(N_1 \cap \omega_2)$. Let $P$ be Cohen forcing which adds a function from $\aleph_2$ to 2 with conditions of a size $\leq \aleph_1$. Then there is a generic $G \subseteq P$ such that $N_1[G], N_2[G] < \langle H(\omega_2)^{V[G]}, \in, < \rangle$, but $N_1[G] \not\preceq N_2[G]$.

Proof. Let $\eta_1 = \min((N_1 \cap \omega_2) \setminus (N_2 \cap \omega_2))$ and $\eta_2 = \min((N_2 \cap \omega_2) \setminus (N_1 \cap \omega_2))$. Then, clearly, $\pi_{N_1,N_2}(\eta_1) = \eta_2$. Now let us pick $g_1 : N_1 \cap \omega_2 \rightarrow 2$ to be $P$-generic function over $N_1$. Let $g_1(\eta_1) = 0$. Consider $g = g_1 \upharpoonright \eta_1$. Clearly, $g \in N_1 \cap P$ and $\pi_{N_1,N_2}(g) = g$. Set $g' = g \cup \{\eta_2, 1\}$. Extend now $g'$ to $g_2 : N_2 \cap \omega_2 \rightarrow 2$ which is $P$-generic function over $N_2$. Set $g'' = g_1 \cup g_2$. Then $g'' \in P$, since $\eta_2 = \min((N_2 \cap \omega_2) \setminus (N_1 \cap \omega_2)) > \sup(N_1 \cap \omega_2)$. Let now $G$ be a generic subset of $P$ with $g'' \in G$. By the construction we have $N_1[G], N_2[G] < \langle H(\omega_2)^{V[G]}, \in, < \rangle$, but $\bigcup G(\eta_1) \neq \bigcup G(\eta_2)$, and so the models $N_1[G], N_2[G]$ cannot be isomorphic.

2.2 The Preparation Forcing

We assume GCH. Fix two cardinals $\kappa$ and $\theta$ such that $\kappa < \theta$ and $\theta$ is regular.

We define a set which is parallel to $\mathcal{P}''$ of Gap 3, i.e. the set of central lines.

Definition 2.2.1 The set $\mathcal{P}'''$ consists of sequences of the form $\langle C^\tau \mid \tau \in s \rangle$ such that

1. $s$ is a closed set of cardinals from the interval $[\kappa^+, \theta]$ satisfying the following:
   
   (a) $|s \cap \delta| < \delta$ for each inaccessible $\delta \in [\kappa^+, \theta]$
   
   (b) $\kappa^+, \theta \in s$
   
   (c) if $\rho^+ \in s$ and $\rho \geq \kappa^+$, then $\rho \in s$
   
   (d) if $\rho \in s$ is singular, then $s$ is unbounded in $\rho$ and $\rho^+ \in s$.
If there is no inaccessible cardinals inside the interval \([\kappa^+, \theta]\), then \(s\) can be taken to be the set of all the cardinals of this interval.

2. For every \(\tau \in s\), \(C^\tau\) is a continuous closed chain of a length less than \(\tau^+\) of elementary submodels of \(\langle H(\theta^+), \in, <, \subseteq, \kappa\rangle\) each of cardinality \(\tau\) such that

(a) for each element \(X \in C^\tau\) we have \(X \cap \tau^+ \in On\) and, hence \(X \supseteq \tau\),

Further we shall denote \(\text{otp}(X \cap \theta^+)\) by simply \(\text{otp}(X)\).

(b) If \(X \in C^\tau\) and there is \(Y \in C^\rho, Y \supseteq X\), for some \(\rho \in s \setminus \tau + 1\), then there is \(Y \in C^\tau^+, Y \supseteq X\) such that for each \(\rho \in s \setminus \tau + 1\) if \(Z \in C^\rho\) and \(Z \supseteq X\), then \(Z \supseteq Y\), where \(\tau^* = \min(s \setminus \tau + 1)\).

(c) If \(X\) is a non-limit element of the chain \(C^\tau\) then

i. \(C^\tau \upharpoonright X := \{Y \mid Y \subseteq X, Y \in C^\tau\} \in X\),

ii. \(\text{cof}(\tau^+) > X \subseteq X\),

iii. if for some \(\rho \in s, \rho > \tau\) we have \(Y \in C^\rho\) with \(\sup(Y) \geq \sup(X)\), then \(X \subseteq Y\),

iv. if for some \(\rho \in s, \rho > \tau\) we have \(Y \in C^\rho\) with \(\sup(Y) < \sup(X)\), then there are \(\rho' \in (s \setminus \rho) \cap X\) and \(Y' \in C^{\rho'} \cap X\) such that \(Y' \supseteq Y\) and \(Y \cap X = Y' \cap X\).

Note that \(\rho' = \rho\), unless there are inaccessible cardinals.

v. If \(\xi \in (s \setminus \tau + 1) \cap X\) and \(C^\xi \cap X \neq \emptyset\), then

\[\bigcup \{Y \in C^\xi \mid Y \in X\} \in X.\]

Denote this union by \((X)_\xi\).

Note that if for some \(\tau \in s, \xi \in s \cap \tau\) and \(Z \in C^\tau\) there is no \(\rho \in s \setminus \tau, A \in C^\xi\) with \((A)_\rho\) defined and so that \(Z \subseteq (A)_\rho\), then \(Z \supseteq B\) for each \(B \in C^\xi\). Since, if for some \(B \in C^\xi\) we have \(\sup(Z \cap \theta^+) < \sup(B \cap \theta^+)\), then, by the condition (iv) above, there are \(\rho \in s \setminus \tau\), \(Y \in C^\rho \cap B\) such that \(Z \subseteq Y\) and \(Z \cap B = Y \cap B\). So, \((B)_\rho\) exists and \(Z \subseteq (B)_\rho\).

vi. \(\langle C^\xi \cap (X)_\xi \mid \xi \in s \setminus \tau + 1, (X)_\xi\\rangle\) is defined \(\in X\).

3. If \(\langle \xi_j \mid j < i\rangle\) is an increasing sequence of elements of \(s\), \(\xi = \bigcup_{j < i} \xi_j\) and \(\langle X_j \mid j < i\rangle\) is an increasing (under the inclusion) sequence such that \(X_j \in C^{\xi_j}\) for each \(j < i\), then \(X = \bigcup_{j < i} X_j\) is in \(C^\xi\).
The next set will be needed here in order to define a $\Delta$-system type triple.

**Definition 2.2.2** The set $\mathcal{P}'''$ consists of all sequences of triples

$$\langle \langle A^{0\tau}, A^{1\tau}, C^{\tau} \rangle \mid \tau \in s \rangle$$

such that for every $\tau \in s$ the following hold:

1. $|A^{1\tau}| \leq \tau$,
2. $A^{0\tau} \in A^{1\tau}$,
3. every $X \in A^{1\tau}$ has cardinality $\tau$ and is either equal to $A^{0\tau}$ or belongs to it,
4. $C^{\tau} : A^{1\tau} \rightarrow P(A^{1\tau})$,
5. $\langle C^{\tau}(A^{0\tau}) \mid \tau \in s \rangle \in \mathcal{P}'''$,
6. (Coherence)
   - if $X, Y \in C^{\tau}(A^{0\tau})$ and $X \in C^{\tau}(Y)$, then $C^{\tau}(X)$ is an initial segment of $C^{\tau}(Y)$ with $X$ being the largest element of it.
7. Let $B \in C^{\tau}(A^{0\tau})$ and $s' = \{ \rho \in s \cap \tau \mid \exists X \in C^{\rho}(A^{0\rho}) \ X \subseteq B \}$. For each $\rho \in s'$ let $B_\rho$ be the largest element of $C^{\rho}(A^{0\rho})$ contained in $B$. Then
   $$\langle C^{\rho}(B_\rho) \mid \rho \in s' \rangle \subseteq \langle C^{\tau}(B) \rangle \subseteq \langle C^{\xi}(A^{0\xi}) \mid \xi \in s \setminus \tau + 1 \rangle \in \mathcal{P}'''$$.

Now we define $\Delta$-system type triples. The definition is more involved than those in the gap 3 case. The basic reason is that instead of using a single central line consisting of ordinals there, we may have here many other central lines. Over each of them $\Delta$-system type triple may appear (thus, for example for the gap 4: there will be $\Delta$-system type triples for $\kappa^+$ relatively to lines of models of cardinality $\kappa^{++}$, and those of cardinality $\kappa^{++}$ relatively to lines of cardinality $\kappa^{+3}$, i.e. ordinals). We define simultaneously also switching using the induction on the rank of sets.

**Definition 2.2.3** Suppose that $p = \langle \langle A^{0\tau}, A^{1\tau}, C^{\tau} \rangle \mid \tau \in s \rangle \in \mathcal{P}'''$, $F \in C^{\tau}(A^{0\tau})$, for some $\tau \in s, \tau < \theta$ and $F_0, F_1 \in F$. We say that the triple $F_0, F_1, F$ is of $\Delta$-system type iff

1. $F_0$ is the immediate predecessor of $F$ in $C^{\tau}(A^{0\tau})$
2. $F_1 \prec F$,
3. if for some $\rho \in s, \rho > \tau$ we have $Y \in C^\rho(A^0\rho)$ with $\sup(Y) \geq \sup(F_1)$, then $F_1 \subseteq Y$.

4. if for some $\rho \in s, \rho > \tau$ we have $Y \in C^\rho(A^0\rho)$ with $\sup(Y) < \sup(F_1)$, then there are $\rho' \in (s \setminus \rho) \cap F_1$ and $Y' \in C^{\rho'}(A^{0\rho'}) \cap F_1$ such that $Y' \supseteq Y$ and $Y \cap F_1 = Y' \cap F_1$.

Here we need to consider two possibilities: $\tau^+ \in s$ or $\tau^+ \not\in s$ and then $\min(s \setminus \tau + 1)$ is an inaccessible cardinal. We will treat both possibilities similar. Denote $\min(s \setminus \tau + 1)$ by $\tau^*$. So $\tau^*$ is either $\tau^+$ or $\tau^*$ is an inaccessible.

5. There is $H_i \in A^{1\tau^*} \cap F_i$ which the maximal under inclusion, where $i \in \{0, 1\}$.

6. There are $G_0, G_1 \in C^{\tau^*}(A^{0\tau^*}) \cap F$ such that
   
   (a) $\cof(G_0 \cap (\tau^*)^+) = \cof(G_1 \cap (\tau^*)^+) = \tau^*$,
   
   (b) $G_0 \in F_0$ and $G_1 \in F_1$
   
   (c) $F_0 \cap F_1 = F_0 \cap G_0 = F_1 \cap G_1$,
   
   (d) either $G_0 \in G_1$ or $G_1 \in G_0$,
   
   (e) there is a switch of $p \setminus \tau + 1 := \langle\langle A^{0\rho}, A^{1\rho}, C^\rho \mid \rho \in s \setminus \tau + 1\rangle\rangle$ which involves models only with supremums below $\max(\sup(F_0 \cap \theta^+), \sup(F_1 \cap \theta^+))$ which leaves $H_0$ on the central line for $\tau^*$ and moves $H_1, G_0, G_1$ to the central line. Moreover, all the models involved in the switch are in $F$.

   Here we use the induction on the ranks of sets.

   Further let us call $G_0, G_1$ the witnessing models for $F_0, F_1, F$.

   We may refer to $H_0, H_1$ and the models used in the switch as witnessing models as well.

   The next condition will require more similarity:

7. (isomorphism condition)

   the structures

   $\langle F_0, \in, <, \subseteq, \kappa, \tau, C^\tau(F_0), \langle A^{1\rho} \cap F_0 \mid \rho \in (s \setminus \tau) \cap F_0 \rangle, \langle C^\rho \upharpoonright A^{1\rho} \cap F_0 \mid \rho \in s \setminus \tau \rangle, f_{F_0} \rangle$

   and

   $\langle F_1, \in, <, \subseteq, \kappa, \tau, C^\tau(F_1), \langle A^{1\rho} \cap F_1 \mid \rho \in (s \setminus \tau) \cap F_1 \rangle, \langle C^\rho \upharpoonright A^{1\rho} \cap F_1 \mid \rho \in s \setminus \tau \rangle, f_{F_1} \rangle$
are isomorphic over $F_0 \cap F_1$, i.e. the isomorphism $\pi_{F_0,F_1}$ between them is the identity on $F_0 \cap F_1$, where $f_{F_0}: \tau \mapsto F_0$, $f_{F_1}: \tau \mapsto F_1$ are some fixed in advance bijections.

In particular, we will have that $\text{otp}(F_0) = \text{otp}(F_1)$ and $F_0 \cap \tau^* = F_1 \cap \tau^*$.

Note that here we use $C^\rho \upharpoonright A^1_\rho \cap F_i$ ($i < 2$). In the gap 3 case we had only $A^1_\tau$, but it was just an increasing sequence and so served as a replacement of $C^\kappa$ as well.

8. For each $\xi \in s$, if $X \in A^1_{\xi}$ and $X \supseteq F_0, F_1$, then $X \supseteq F$.

Define the switch $q$ of $p$ by $F_0, F_1, F$ to be

$$\langle \langle A^{0_{\xi}}, A^{1_{\xi}}, D^{\xi} \rangle \mid \xi \in s \rangle,$$

where $D^{\xi}$, for $\xi \in s \setminus \tau + 1$ is determined by switching in $p \setminus \tau + 1$ below $\max(\text{sup}(F_0 \cap \theta^+), \text{sup}(F_1 \cap \theta^+))$ which turns $C^{\tau^*}(H_1)$ into an initial segment of $\tau^*$-central line. $D^{\tau}(F) = C^{\tau}(F_1) \setminus F$ and $D^{\tau}(A^{0_{\tau}}) = D^{\tau}(F) \setminus \{X \in C^{\tau}(A^{0_{\tau}}) \mid X \supseteq F \}$. The rest is defined in the obvious fashion by taking images under isomorphisms $\pi_{F_0,F_1}$ etc.

Further let denote such $q$ by $\text{swt}(p, F)$.

Note that it need not be a condition.

Denote by $\text{swt}(p, B_1, \ldots, B_n)$ the result of an application of the switch operation $n$-times: $p_{i+1} = \text{swt}(p_i, B_i)$, for each $1 \leq i \leq n$, where $p_1 = p$ and $\text{swt}(p, B_1, \ldots, B_n) = p_{n+1}$.

Note that there is no $\Delta$-system type triples in the cardinality $\theta$.

Now we define the preparation forcing $\mathcal{P}'$.

**Definition 2.2.4** The set $\mathcal{P}'$ consists of elements of the form

$$\langle \langle A^{0_{\tau}}, A^{1_{\tau}}, C^{\tau} \rangle \mid \tau \in s \rangle$$

so that the following hold:

1. $\langle \langle A^{0_{\tau}}, A^{1_{\tau}}, C^{\tau} \rangle \mid \tau \in s \rangle \in \mathcal{P}''$.

We call $C^{\tau}(A^{0_{\tau}})$ $\tau$-central line of $\langle \langle A^{0_{\tau}}, A^{1_{\tau}}, C^{\tau} \rangle \mid \tau \in s \rangle$.

The following conditions describe a special way in which $A^{1_{\tau}}$ is generated from the central line, for each $\tau \in s$.

2. Let $B \in A^{1_{\tau}}$. Then $B \in C^{\tau}(A^{0_{\tau}})$ (i.e. it is on the central line) or there there is a finite sequence $\text{piste}(B)$ of models in $\bigcup_{\rho \in s \setminus \tau} A^{1_{\rho}}$ that terminates with $B$. We call this sequence a piste to $B$ and it will be defined recursively below.
First let us define *blue (easy) pistes* and the set \( bp(A^{0\tau}) \) of elements of \( A^{1\tau} \) reachable by such pistes from \( A^{0\tau} \).

Set \( C^\tau(A^{0\tau}) \subseteq bp(A^{0\tau}) \). If \( B \in C^\tau(A^{0\tau}) \), then set \( piste(B) = \langle B \rangle \).

Suppose now that \( A \in bp(A^{0\tau}) \) and \( bp(A) \) is defined. Again, set \( C^\tau(A) \subseteq bp(A^{0\tau}) \). If \( B \in C^\tau(A) \setminus \{ A \} \), then set \( piste(B) = piste(A) \cup \langle B \rangle \).

It is allowed to continue a blue piste via a \( \Delta \)-system triple.

**Blue Piste Continuation—First Continuation.**

Suppose now that \( A \in bp(A^{0\tau}) \), \( bp(A) \) is defined and there are models \( A_0, A_1 \in A \cap A^{1\tau} \) such that

(a) the triple \( A_0, A_1, A \) is of a \( \Delta \)-system type with respect to \( \langle \langle A^{0\xi}, A^{1\xi}, C^\xi \rangle \mid \xi \in s \setminus \tau \rangle \),

(b) \( A_0 \in C^\tau(A) \),

Then we add \( A_1 \) to \( bp(A^{0\tau}) \) and \( piste(A_1) \) is defined by adding \( A_1, A_0 \) and the models witnessing the \( \Delta \) system to \( piste(A) \).

Now let \( B \in A^{1\tau} \). We define \( piste(B) \) the piste leading to \( B \). If \( B \in bp(A^{0\tau}) \), then \( piste(B) \) was already defined. Suppose that \( B \not\in bp(A^{0\tau}) \). We follow first the blue piste down from \( A^{0\tau} \) until reaching the least element \( A \) of \( bp(A^{0\tau}) \) with \( B \in A \), i.e. first pick the least element of \( C^\tau(A^{0\tau}) \) with \( B \) inside if it is not of a \( \Delta \)-system type, then set \( A \) to be this element; otherwise, take the immediate predecessor of it which is not on the central line and continue down through it etc.

We continue and define recursively (and using \( \in \)-induction) in addition sets of models connected by a piste to a given model \( T \in \bigcup_{\nu \in s} A^{1\nu} \) which will be denoted by \( pc(T) \).

Require that \( bp(T) \subseteq pc(T) \).

**Second Continuation.**

There are \( \rho \in s \cap A, \rho > \tau, T^*, T_0, T_1, T \in A^{1\rho} \cap A \) such that

(a) \( T^* \) is on the central line relatively to \( A \), i.e. once we make the switches along the piste up to \( A \) which move \( A \) to the central line, then \( T^* \) is moved their as well; other way to state this: if \( Z \) is the largest model of \( A^{1\rho} \cap A \), then \( T^* \in C^\rho(Z) \).

In particular, if \( A \) is the first model of the piste or only the first continuation was used on the way to \( A \), then \( T^* \in C^\rho(A^{0\rho}) \).

(b) \( T, T_0, T_1 \in pc(T^*) \).

Note that \( T^* \in A \), so we can assume that \( pc(T^*) \) is already defined.
(c) \( piste(T^*, T) \in A \),

(d) \( T_0, T_1, T \) are of a \( \Delta \)-system type,

(e) There is \( E \in bp(A) \) such that

i. \( E \subseteq T_0 \),

ii. there is no \( E' \in bp(A) \) with \( E \subsetneq E' \subsetneq T_0 \),

iii. \( B \subseteq \pi_{T_0,T_1}(E) \).

We add all the relevant models above, i.e. \( T^*, T_0, T_1, T, \pi_{T_0,T_1}(E) \) etc. to \( piste(B) \) and \( \pi_{T_0,T_1}(E) \) to \( pc(A) \). Continue further from \( \pi_{T_0,T_1}(E) \).

Note that \( \pi_{T_0,T_1}(E) \) is an immediate predecessor of \( A \). Once \( E \) is a proper subset of \( A_0 \), this produces an immediate predecessor of \( A \) of smaller order type. Also this process applied to different \( T \)’s and \( E \)’s may generate a large number of immediate predecessors of \( A \) of different order types.

The next continuation is just an iteration of the previous one.

**Third Continuation.**

There are \( n < \omega \) and a sequence \( \langle A_i \mid i \leq n \rangle \) of elements of \( A^{1\tau} \cap A \) such that

(a) \( A_0 \in bp(A) \),

(b) \( A_1 \) is obtained from \( A_0 \) as in Second Continuation.

(c) For every \( i, 2 < i \leq n \), \( A_i \) is obtained using \( A_{i-1} \). Namely there are \( E^i \in bp(A_{i-1}), \rho_i \in s \cap A, \rho^i > \tau, T^{i*}, T_0^i, T_1^i, T^i \in A^{1\rho^i} \cap A \) such that

i. \( T^{i*} \) is on the central line relatively to \( A \),

ii. \( T_0^i, T_1^i, T^i \in pc(T^{i*}) \),

iii. \( T_0^i, T_1^i, T^i \) are of a \( \Delta \)-system type,

iv. \( piste(T^{i*}, T^i) \in A \),

v. \( E^i \subseteq A_{i-1} \cap T_0^i \),

vi. there is no \( E' \in bp(A_{i-1}) \) with \( E^i \subsetneq E' \subsetneq T_0^i \),

vii. \( A_i = \pi_{T_0^i,T_1^i}(E^i) \),

(d) \( B \subseteq A_n \).

We add all the relevant models above to \( piste(B) \) and all models of \( \bigcup_{i \leq n} pc(A_i) \) to \( pc(A) \).
The next condition insures a kind of symmetry:

3. Let \( T_0^n, T_1^n, E^n \) be as in Third Continuation. Then \( \pi_{T_0^n, T_1^n}[pc(E^n)] = pc(\pi_{T_0^n, T_1^n}(E^n)) \).
Moreover \( \pi_{T_0^n, T_1^n} \upharpoonright pc(E^n) \) is an isomorphism between the corresponding structures.

We require that every element of \( A^{1\tau} \) is connected to \( A^{0\tau} \) by a piste:

4. \( A^{1\tau} = pc(A^{0\tau}) \), for every \( \tau \in s \).

5. Let \( F_0, F_1, F \in A^{1\tau} \) be of a \( \Delta \)-system type, \( F_0, F \in C^\tau(A^{0\tau}) \). Suppose that \( \xi \in s \cap \tau \), \( (A^{0\xi})_\tau \) exists and \( (A^{0\xi})_\tau \supseteq F_0 \). Let \( X \in C^\xi(A^{0\xi}) \) be the least with \( (X)_\tau \supseteq F_0 \). Then \( (X)_\tau \supseteq F \).

The meaning of this condition is that it is impossible to have a small model in between models of a \( \Delta \)-system type of larger cardinality. It will not be very restrictive for our further purposes, since we will be always able to increase first elements of \( \mathcal{P}' \) by adding models of cardinality \( \tau \) at the top, and only then to make a \( \Delta \)-system type triple.

The next condition is relevant once inaccessibles are present.

6. Let \( F_0, F_1, F \in A^{1\tau} \) be of a \( \Delta \)-system type, \( F_0, F \in C^\tau(A^{0\tau}) \). Suppose that \( \xi \in s \cap \tau \), \( X \in C^\xi(A^{0\xi}) \), for some \( \rho \in s \setminus \tau \), \( (X)_\rho \) exists and \( (X)_\rho \supseteq F_0 \). Then \( (X)_\rho \supseteq F \).

7. (uniqueness) Let \( F_0, F_1, F'_1, F \in A^{1\tau} \). If both triples \( F_0, F_1, F \) and \( F'_0, F'_1, F \) are of a \( \Delta \)-system type, then \( \{F_0, F_1\} = \{F'_0, F'_1\} \).

The following lemma follows directly from the definition.

**Lemma 2.2.5** Let \( \langle \langle A^{0\xi}, A^{1\xi}, C^\xi \rangle \mid \xi \in s \rangle \in \mathcal{P}' \). Then \( A^{1\theta} \) is a chain.

**Proof.** Just note that we have no \( \Delta \)-system triples in the cardinality \( \theta \). Hence each model in \( A^{1\theta} \) is on the \( \theta \)-central line, i.e. on \( C^\theta(A^{0\theta}) \).
\( \square \)

We need to allow a possibility to change the component \( C^\tau \) in elements of \( \mathcal{P}' \) and replace one central line by another. It is essential for the definition of an order on \( \mathcal{P}' \) given below.

**Definition 2.2.6** Let \( r, q \in \mathcal{P}' \). Then \( r \geq q \) (\( r \) is stronger than \( q \)) iff there is \( p = swt(r, B_1, \ldots, B_n) \in \mathcal{P}' \) for some \( B_1, \ldots, B_n \) appearing in \( r \) so that the following hold, where

\[
p = \langle \langle A^{0\xi}, A^{1\xi}, C^\xi \rangle \mid \xi \in s \rangle
\]

\[
q = \langle \langle B^{0\xi}, B^{1\xi}, D^\xi \rangle \mid \xi \in s' \rangle
\]

53
1. \( s' \subseteq s \),

2. \( B^{0\xi} \in C^{\xi}(A^{0\xi}) \), for each \( \xi \in s' \),

3. \( q = p \upharpoonright \{ \langle B^{0\xi} \mid \xi \in s' \rangle \} \),

   where \( p \upharpoonright \{ \langle B^{0\xi} \mid \xi \in s' \rangle \} = \{ \langle B^{0\xi}, A^{1\xi} \cap (B^{0\xi} \cup \{B^{0\xi}\}) \mid \xi \in s' \rangle \} \),

4. for each \( \xi \in s' \) and \( X \in C^{\xi}(A^{0\xi}) \), \( q \in X \),

5. for each \( \xi \in s \setminus s' \) and \( X \in C^{\xi}(A^{0\xi}) \), \( q \in X \).

The meaning of the last two conditions is that new models over central lines supposed to be above all old ones.

Let \( p = \langle \langle A^{0\tau}, A^{1\tau}, C^{\tau} \rangle \mid \tau \in s \rangle \) be a switch of \( p \) which restores \( A^{0\tau}_{j-1} \) to \( \tau \)-th central line, i.e. \( A^{0\tau}_{j-1} \in C^{\tau}(A^{0\tau}) \), for every \( \tau \in s_{j-1} \).

Then pick an increasing continuous sequence \( \langle A^{0\tau} \mid \tau \in s \rangle \) such that for every \( \tau \in s \)

**Lemma 2.2.7** The function \( p \mapsto p \setminus \eta \) projects the forcing \( P' \) onto the forcing \( P'_{\geq \eta} \).

**Remark.** Note that we split at \( \eta \) only \( p \)'s in \( P' \) with \( \eta \) inside \( s \) of \( p \). The reason is that in the case of \( \eta \not\in s \) an extension of \( p \setminus \eta \) may include models of cardinality \( \eta \) which for example belong to models of \( p \) of cardinalities below \( \eta \). Such extensions will be incompatible with \( p \).

**Proof.** Let \( p \in P' \) and \( q \in P'_{\geq \eta} \), \( q \geq p \setminus \eta \). We need to find \( r \in P' \), \( r \geq p \) such that \( r \setminus \eta \geq q \). Let us take an equivalent to \( q \) condition \( q' \) in \( P'_{\geq \eta} \) (a switching of \( q \)) with the central lines of \( q' \) extending those of \( p \setminus \eta \). Then \( p \upharpoonright q' \) the combination of \( p \) with \( q' \) will be in \( P' \), \( p \upharpoonright q' \geq p \) and \( (p \upharpoonright q') \setminus \eta = q' \).

\( \square \)

**Lemma 2.2.8** \( P'_{\geq \eta} \) is \( \eta^+ \)-strategically closed.

**Proof.** We define a winning strategy for the player playing at even stages. Thus suppose \( \langle p_j \mid j < i \rangle \), \( p_j = \langle \langle A^{0\tau}_j, A^{1\tau}_j, C^{\tau}_j \rangle \mid \tau \in s_j \rangle \) is a play according to this strategy up to an even stage \( i < \eta^+ \).

Split into two cases.

**Case 1.** \( i = j + 1 \).

Let \( p = \langle \langle A^{0\tau}, A^{1\tau}, C^{\tau} \rangle \mid \tau \in s = s_j \rangle \) be a switch of \( p_j \) which restores \( A^{0\tau}_{j-1} \) to \( \tau \)-th central line, i.e. \( A^{0\tau}_{j-1} \in C^{\tau}(A^{0\tau}) \), for every \( \tau \in s_{j-1} \).

Then pick an increasing continuous sequence \( \langle A^{0\tau}_j \mid \tau \in s \rangle \) such that for every \( \tau \in s \)

\[ \text{54} \]
(a) $\text{cof}(\tau) > A^0_i \subseteq A^0_i$,

(b) $\langle p_k \mid k < i \rangle, p, \langle A^{0\tau'}_i \mid \tau' < \tau \rangle \in A^0_i$.

Set $p_i = \langle A^{0}_i, A^{1}_i, C_i^\tau \mid \tau \in s \rangle$, where

$$A^{1}_i = A^{1\tau}_i \cup \{A^{0}_i\}, C^\tau_i = C^\tau(A^{0\tau}_i) \cup \{\langle A^{0\tau}_i, A^0_i \cup \{A^{0}_i\}\rangle\}.$$ 

Case 2. $i$ is a limit ordinal.

Set first

$$s = \text{the closure of } \bigcup_{j<i} s_j.$$ 

For every $\tau \in \bigcup_{j<i} s_j$, define

$$A^{0\tau}_i = \bigcup_{j<i} A^{0\tau}_j, A^{1\tau}_i = \bigcup_{j<i} A^{1\tau}_j \cup \{A^{0\tau}_i\},$$

$$C^\tau_i = \bigcup_{j<i, j \text{ is even}} C^\tau_j \cup \{\langle A^{0\tau}_i, A^{0\tau}_j \rangle \cup \bigcup \{C^\tau_j(A^{0\tau}_j) \mid j \text{ is even}\}\}.$$ 

If $\tau \in s \setminus \bigcup_{j<i} s_j$, then set

$$A^{0\tau}_i = \bigcup_{\tau' \in (\bigcup_{j<s_j} \tau) \setminus \tau} A^{0\tau'}_i,$$

$$A^{1\tau}_i = \{A^{0\tau}_i\} \text{ and } C^\tau(A^{0\tau}_i) = \{\langle A^{0\tau}_i, A^{0\tau}_i \rangle\}.$$ 

As an inductive assumption we assume that at each even stage $j < i$, $p_j$ was defined in the same fashion. Then $p_i = \langle A^{0\tau}_i, A^{1\tau}_i, C^\tau_i \mid \tau \in s \rangle$ will be a condition in $P'$ stronger than each $p_j$ for $j < i$.

□

If we take $\eta = \theta$, then it is easy to show the following:

**Lemma 2.2.9** $\langle P'_{\geq \theta}, \leq \rangle$ is $\theta^+$-closed.

Let $p = \langle A^{0\xi}, A^{1\xi}, C^{\xi} \mid \xi \in s \rangle \in P'$ and $\eta \in s$. Set $p \upharpoonright \eta = \langle A^{0\xi}, A^{1\xi}, C^{\xi} \mid \xi \in s \cap \eta \rangle$.

Let $G(P'_{\geq \eta})$ be a generic subset of $P'_{\geq \eta}$. Define $P'_{<\eta}$ to be the set of all $p \upharpoonright \eta$ for $p \in P'$ with $p \setminus \eta \in G(P'_{\geq \eta})$.

**Lemma 2.2.10** $P' \simeq P'_{\geq \eta} * P'_{<\eta}$.

**Lemma 2.2.11** If $\eta$ is a regular cardinal, then the forcing $P'_{<\eta}$ satisfies $\eta^+$-c.c. in $V_{P'_{\geq \eta}}$. 

55
Proof. Suppose otherwise. Let us assume that

$$\emptyset \preceq \{ p_\alpha = \langle A_\alpha^{0^\gamma}, A_\alpha^{1^\gamma}, C_\alpha^\tau \mid \tau \in \bar{g}_\alpha \mid \alpha < \eta^+ \} \text{ is an antichain in } P'_{\geq \eta}$$

Without loss of generality we can assume that each $A_\alpha^{0^\gamma}$ is forced to be a successor model, otherwise just extend conditions by adding one additional models on the top. Define by induction, using Lemma 2.2.8, an increasing sequence $\langle q_\alpha \mid \alpha < \eta^+ \rangle$ of elements of $P'_{\geq \eta}$ and a sequence $\langle p_\alpha \mid \alpha < \eta^+ \rangle$, $p_\alpha = \langle A_\alpha^{0^\gamma}, A_\alpha^{1^\gamma}, C_\alpha^\tau \mid \tau \in s_\alpha \rangle$ so that for every $\alpha < \eta^+$

$$q_\alpha \upharpoonright_{P'_{\geq \eta}} \langle A_\alpha^{0^\gamma}, A_\alpha^{1^\gamma}, C_\alpha^\tau \mid \tau \in \bar{g}_\alpha \rangle = \bar{p}_\alpha.$$ 

For a limit $\alpha < \eta^+$ let $\bar{q}_\alpha$ be an upper bound of $\{ q_\beta \mid \alpha < \eta^+ \}$, as defined in Lemma 2.2.8 and $q_\alpha$ be its extension deciding $\bar{p}_\alpha$. Also assume that $p_\alpha \in A^{0^\eta}(q_\alpha)$, where $A^{0^\eta}(q_\alpha)$ is the maximal model of $q_\alpha$ of cardinality $\eta$.

Note that the number of possibilities for $s_\alpha$'s is at most $\eta$, since if $\eta$ is an inaccessible, then by Definition 2.2.1(1), $|s_\alpha| < \eta$ and if $\eta$ is an inaccessible cardinal, then $\eta = (\eta^-)^+$ (remember that $\eta$ is a regular cardinal). So $s_\alpha \subseteq \eta^+ \cup \{ \eta^- \}$. But $2^{\eta^-} = \eta$.

Hence, by shrinking if necessary, we may assume that each $s_\alpha = s^*$, for some $s^* \subseteq \eta$. Let $\eta^* = \max(s^*)$.

Form a $\Delta$-system. By shrinking if necessary assume that for some stationary $S \subseteq \eta^+$ we have the following for every $\alpha < \beta$ in $S$:

1. $A_\alpha^{0^\eta} \cap A^{0^\eta}(\bar{q}_\alpha) = A_\beta^{0^\eta} \cap A^{0^\eta}(\bar{q}_\beta) \in A^{0^\eta}(q_0)$

2. $\langle A_\alpha^{0^\eta}, \varepsilon, \subseteq, \subset, \kappa, C_\alpha^{0^\eta}, f_{A_\alpha^{0^\eta}}, A_\alpha^{1^\gamma}, q_\alpha \cap A^{0^\eta} \rangle$ and $\langle A_\beta^{0^\eta}, \varepsilon, \subseteq, \subset, \kappa, C_\beta^{0^\eta}, f_{A_\beta^{0^\eta}}, A_\beta^{1^\gamma}, q_\beta \cap A^{0^\eta} \rangle$ are isomorphic over $A_\alpha^{0^\eta} \cap A_\beta^{0^\eta}$, i.e. by isomorphism fixing every ordinal below $A_\alpha^{0^\eta} \cap A_\beta^{0^\eta}$, where

$$f_{A_\alpha^{0^\eta}} : \eta^* \longleftrightarrow A_\alpha^{0^\eta}$$

and

$$f_{A_\beta^{0^\eta}} : \eta^* \longleftrightarrow A_\beta^{0^\eta}$$

are the fixed enumerations.

Note that $|A_\alpha^{0^\eta} \cap A_\beta^{0^\eta}| \leq \eta^*$. So we can define a function $h_\alpha : \eta^* \to \eta$ by mapping each $i < \eta$ to the order type $A_\alpha^{0^\eta} \cap \theta^+$ between the $i$-th element of $A_\alpha^{0^\eta} \cap A_\beta^{0^\eta} \cap \theta^+$ and its
immediate successor in $A^0_{\alpha} \cap A^0_{\beta} \cap \theta^+$. The total number of such $h_{\alpha}$'s is at most $\eta$, hence by shrinking if necessary we will get the same function. This will insure the isomorphism which is the identity on $A^0_{\alpha} \cap A^0_{\beta} \cap \theta^+$ and, hence, on $A^0_{\alpha} \cap A^0_{\beta}$.

We claim that for $\alpha < \beta$ in $S$ it is possible to extend $q_3$ to a condition forcing compatibility of $p_\alpha$ and $p_\beta$. Proceed as follows. Pick $A$ to be an elementary submodel of cardinality $\eta^*$ with $p_\alpha, p_\beta, q_3$ inside.

Then the triple $A^0_{\alpha}, A^0_{\beta}, A$ is of a $\Delta$-system type relatively to $q_3$, by (2) above. Use this to construct a condition stronger than both $p_\alpha, p_\beta$.

Let $\langle A(\tau) \mid \tau \in s^* \cup s(q_3) \rangle$ (where $s(q_3)$ denotes the support of $q_3$) be an increasing and continuous sequence of elementary submodels such that for each $\tau \in s^*$ the following hold:

- $p_\alpha, p_\beta, q_3, A \in A(\tau)$,
- $|A(\tau)| = \tau$.

Extend $q_3$ to $q$ by adding to it $\langle A(\tau) \mid \tau \in s(q_3) \rangle$, as maximal models, i.e. $A^0_\tau(q) = A(\tau)$. Set $p = \langle (A^0_\tau, A^1_\tau, C^\tau) \mid \tau \in s^* \rangle$, where

$$A^0_{\eta^*} = A(\eta)^*, A^1_{\eta^*} = A^1_{\alpha} \cup A^1_{\beta} \cup \{A, A^0_{\eta^*}\},$$

$$C^\tau = C^0_\alpha \cup C^0_\beta \cup \langle A, C^0_\beta(A^0_{\eta^*}) \rangle \cup \langle A^0_{\eta^*}, C^0_\beta(A^0_{\eta^*} \cap A^0_{\eta^*}) \rangle,$$

and for each $\tau \in s^* \cap \eta^*$,

$$A^0_\tau = A(\tau), A^1_\tau = A^1_{\alpha} \cup A^1_{\beta} \cup \{A^0_\tau\},$$

$$C^\tau = C^\tau_\alpha \cup C^\tau_\beta \cup \langle A^0_\tau, C^\tau_\beta(A^0_\tau) \cap A^0_\tau \rangle.$$

The triple $A^0_{\eta^*}, A^0_{\eta^*}, A$ is of a $\Delta$-system type relatively to $q$, by (2) above. It follows that $\langle p, q \rangle \in \mathcal{P}$. Thus the condition (2) of Definition 2.2.4 holds since each of $\langle p_\alpha, q \rangle, \langle p_\beta, q \rangle$ satisfies it.

\[\square\]

**Lemma 2.2.12** Let $\eta, \kappa < \eta \leq \theta$, be a regular cardinal. Then in $V^{\mathcal{P}'}$ we have $2^n = \eta^+$.

**Proof.** Fix $N < H((2^\lambda)^+)$, for $\lambda$ large enough, such that $\mathcal{P}' \in N$, $|N| = \eta^+$ and $\eta N \subseteq N$. We find $p^N_{\geq \eta^+} \in \mathcal{P}'_{\geq \eta^+}$ which is $N$-generic for $\mathcal{P}'_{\geq \eta^+}$, using $\eta^+$-strategic closure of $\mathcal{P}'_{\geq \eta^+}$. Let $G(\mathcal{P}'_{\geq \eta^+})$ be a generic subset of $\mathcal{P}'_{\geq \eta^+}$ with $p_{\geq \eta^+} \in G(\mathcal{P}'_{\geq \eta^+})$. Then, $N[p_{\geq \eta^+}] \prec V[G(\mathcal{P}'_{\geq \eta^+})]$. By Lemma 2.2.11, $\mathcal{P}'_{\geq \eta^+}$ satisfies $\eta^+-c.c.$ in $V[G(\mathcal{P}'_{\geq \eta^+})]$. In particular, $\mathcal{P}'_{\geq \eta^+}$ satisfies $\eta^+-c.c.
Let $G(P) = \eta$ be a generic subset of $\mathcal{P} = \eta$ over $V[G(P)]$. Denote $N[p \geq \eta+]$ by $N_1$. Then $N_1[N_1 \cap G(P)] \prec V[G(P)]G(P)$, since each antichain for $P = \eta$ has cardinality at most $\eta^+$. Hence, if it belongs to $N_1$ then it is also contained in $N_1$. Denote $N_1[N_1 \cap G(P)]$ by $N_2$.

Consider $P \prec \eta$. Clearly this is a forcing of cardinality $\eta^+$. By Lemma 2.2.11, $P \prec \eta$ satisfies $\eta^+\text{c.c.}$, so $P \prec \eta$ is a nice suborder of $P \prec \eta$. Thus, let $G \subseteq P \prec \eta$ be generic over $V[G(P)]G(P) \prec \eta$. Then $H$ is $P \prec \eta$ generic over $V[G(P)]G(P) \prec \eta$.

This follows due to the fact that $N_2$ is an elementary submodel closed under $\eta$-sequences of its elements. Namely, $|N_2| = \eta$, so $A \subseteq N_2$.

Now, by elementarity, $A$ is a maximal antichain in $P \prec \eta$. So there is $p \in G \cap A$. Finally, $A \subseteq N_2$ implies that $p \in N_2$ and hence $p \in H$.

We claim that each subset of $\eta$ in $V[G(P)]G(P) \prec \eta$ is already in $N_2[G]$. It is enough since $|N_2[G]| = |N| = \eta^+$.

Work in $V$. The construction below can be performed above any condition of $P$ stronger than $p_0 \in P \prec \eta$ (which is needed in order to preserve the elementarity of $N$ in generic extensions). So, by density arguments, we will obtain the desired conclusion.

Let $\bar{a}$ be a name of a function from $\eta$ to $2$. Define by induction (using the strategic closure of the forcings and $\eta^+\text{c.c.}$ of $P \prec \eta$) sequences of ordinals

$$\langle \delta_\beta \mid \beta < \eta \rangle, \langle \gamma(\alpha, \beta) \mid \beta < \eta, \alpha < \delta_\beta \rangle$$

and sequences of conditions

$$\langle p_\alpha(\beta) \mid \alpha < \delta_\beta, \beta < \eta \rangle, \langle p(\beta) \mid \beta < \eta \rangle$$

such that

1. for each $\beta < \eta$, $\delta_\beta < \eta^+$,
2. for each $\beta < \eta$, $\langle p_\alpha(\beta) \mid \alpha < \delta_\beta \rangle$ is an increasing sequence of elements of $P \prec \eta$, and $p(\beta)$ is its upper bound obtained as in the Strategic Closure Lemma 2.2.8,
3. $p(0) \geq \eta^+$,
4. the sequence $\langle p(\beta) \mid \beta < \eta \rangle$ is increasing.
Claim 2.2.12.1

Clearly, b was done at the end of the proof of Lemma 2.2.11. Denote such condition by the choice of p and let q be the sequences corresponding to N over p.

Let L for each a if for some a is in N over p, we can just extent the model (β, α) corresponds to p, p ∈ L and let q | α < δβ are in G(η ∈ P).

Define a name of a subset of K, L, M.

Turn for a moment to a generic extension. Let G(N) be a generic subset of P with p(η) \ η+ ∈ G(η ∈ P). Pick K in N realizing the same type as those of L in H(2\^\alpha)[G(N)] over N ∩ L. Note that N ∩ L is a subset of N of cardinality η and, hence, it is in N.

Let

\langle q(\beta) | \beta < \eta \rangle, \langle q(\alpha) | \alpha < \delta \rangle (\beta < \eta)

be the sequences corresponding to

\langle p(\beta) | \beta < \eta \rangle, \langle p(\beta) | \beta < \eta \rangle

and let q(η) corresponds to p(η). Note that q(β) \ η+, q(α) \ η+ are in G(η ∈ P), since p(β) \ η+, p(α) \ η+ are in G(η ∈ P). Then,

\langle q(\beta) \ η+, q(\alpha) \ η+ ≤ p(\eta) \ η+ \in G(\eta ∈ P) \rangle

by the choice of p(η) \ η+ and since p(η) \ η+ \leq p(\eta) \ η+ ∈ G(\eta ∈ P).

Combine now K, L into one condition making them a splitting point. Let M be a model of cardinality η such that K, L ∈ M. Then the triple L, K, M will be of a Δ-system type relatively to p(η) \ L \ M (which is defined in the obvious fashion with L ∈ C^n(M)). Now, we add q(η) \ K to p(η) \ L \ M and turn this into condition in P, exactly the same way as it was done at the end of the proof of Lemma 2.2.11. Denote such condition by r.

Define a name b of a subset of η to be

\{ q(\alpha), γ(\alpha, β) | α < \delta, β < \eta \}.

Clearly, b is in N.

Claim 2.2.12.1 r|_b = b.
Proof. Let \( G \) be a generic subset of \( \mathcal{P}' \) with \( r \in G \). Then also \( p(\eta)_{\geq \eta}, q(\eta)_{\geq \eta} \in G \). Now, for each \( \beta < \eta \) there is \( \alpha < \delta_{\beta} \) with \( p_\beta(\alpha) \in G \) (just otherwise there will be a condition \( t \) in \( G \) forcing that for some \( \beta \) there is no \( \alpha < \delta_{\beta} \) with \( p_\beta(\alpha) \in G \). Extend it to \( t' \) deciding the value \( a(\beta) \). By (6) there is \( \alpha < \delta_{\beta} \) such that \( t', p_\beta(\alpha) \) are compatible). Let \( r' \in G \) be a common extension of \( r \) and \( p_\beta(\alpha) \). Recall that \( L, K, M \) is a triple of a \( \Delta \)-system type in \( r \) and the isomorphism \( \pi_{LK} \) moves \( p_\beta(\alpha) \) to \( q_\beta(\alpha) \). Hence \( q_\beta(\alpha) \leq r' \). But then \( q_\beta(\alpha) \in G \).

\( \square \) of the claim.

\( \square \)

Remark 2.2.13 The proof of 2.2.12 actually shows that in \( V[G(\mathcal{P}_{\geq \eta})] \) the forcing \( \mathcal{P}_{\leq \eta} \) is equivalent to the forcing \( N_2 \cap \mathcal{P}_{\leq \eta} \) of cardinality \( \eta^+ \). Thus, instead of a name \( a \) of a subset of \( \eta \) take a \( \mathcal{P}'_{\geq \eta} \)-name of a maximal antichain of \( \mathcal{P}'_{\leq \eta} \). By \( \eta^+-\text{c.c.} \) of \( \mathcal{P}'_{\leq \eta} \), the antichain has cardinality \( \leq \eta \). Using the strategic closure of \( \mathcal{P}'_{\geq \eta} \) we produce a condition deciding all the elements of the antichain. Let \( L \) be its top model of cardinality \( \eta \). Find \( K \) as in the proof of 2.2.12 and copy the antichain to \( N_2 \). Finally, any \( N_2 \cap \mathcal{P}_{\leq \eta} \)-generic will intersect this image, which in turn will imply that on the \( L \)-side the same happens.

The models of small cardinalities (i.e. \( < \eta \)) will always be moved from \( K \) to \( L \) and vice verse by the definition of Continuations, which is much more relaxed here than in [9].

Let us show that \( 2^\eta = \eta^+ \) for singular \( \eta \)'s as well. Note that it is possible to deduce this appealing to Core Models arguments (provided that there is no inner model with too large cardinals).

Lemma 2.2.14

(a) Let \( \eta \) be a singular cardinal in \( [\kappa^+, \theta] \). Then in \( V^{\mathcal{P}'} \) we have \( 2^\eta = \eta^+ \).

(b) \( V^{\mathcal{P}'} \) satisfies GCH.

Proof. It is enough to proof (a) since then (b) will follow by the previous lemma 2.2.12.

Fix a singular cardinal \( \eta \in [\kappa^+, \theta] \). Let \( N, p_{\geq \eta}, N_1, N_2, q \) be as in the proof of 2.2.12.

Pick an increasing sequence \( \langle \eta_i \mid i < \text{cof}(\eta) \rangle \) of regular cardinals cofinal in \( \eta \). Let \( \langle L_i \mid i < \text{cof}(\eta) \rangle \) be an increasing sequence of elementary submodels of \( H(2^\lambda)^+ \) such that

1. \( |L_i| = \eta_i \),
2. \( L_i \supseteq \eta_i \),
3. \( \omega > L_i \subseteq L_i \),
4. \( \langle L_j \mid j < i \rangle \in L_i \),

60
Set \( L = \bigcup_{i < \text{cof}(\eta)} L_i \).

Now we construct a sequence \( \langle p(i) \mid i < \text{cof}(\eta) \rangle \) of elements of \( \mathcal{P}' \) such that

1. \( p(0) \geq p_{\geq \eta}^+ \),

2. \( p(i)_{\geq \eta_i} \) is \((L_i, \mathcal{P}')\)-generic over \( p(i)_{< \eta_i} \), i.e. for any maximal antichain \( A \subseteq \mathcal{P}' \) with \( A \in L_i \), if some \( q \) is in \( A \) and is compatible with \( p(i) \), then there is \( r \geq q, p(i) \) such that for some \( r' \leq r \) we have \( r' \in A \cap L_i \).

3. \( p(j) \upharpoonright \eta_i = p(i)_{< \eta_i} \), for every \( j > i \),

4. \( p(i) \in L_{i+1} \).

The construction is by recursion and uses that at each \( i < \text{cof}(\eta) \) strategic closure of \( \mathcal{P}'_{\geq \eta_i} \) together with \( \eta_i^+ \)-c.c. of \( \mathcal{P}'_{< \eta_i} \).

Now let \( p \) be the result of putting \( \langle p_i \mid i < \text{cof}(\eta) \rangle \) together as in the strategic closure lemma 2.2.8 with \( L \) the top model of cardinality \( \eta \). Note that if \( G \subseteq \mathcal{P}' \) with \( p \in G \), then \( L[G \cap L] \prec H((2^{\lambda^+})^+)[G] \). Thus, if \( A \in L \) is a maximal antichain, then \( A \in L_i \) for some \( i < \text{cof}(\eta) \) and by (2) above some \( r' \in G \) is in \( A \cap L_i \).

In particular, \( \sim \) can be computed correctly inside \( L \). We continue further as in 2.2.11 define \( K \) etc.,with \( p \) replacing \( p(\eta) \) of 2.2.11.

\( \square \)

### 2.3 The Intersection Property- beyond 3

We deal here with the intersection properties in context of gaps above 3.

The following definition is a straightforward generalization of the intersection property for gap 3 from Chapter 1.

**Definition 2.3.1** Let \( \langle \langle A^{0\xi}, A^{1\xi}, C^{\xi} \rangle \mid \xi \in s \rangle \in \mathcal{P}', \tau \leq \rho \) and \( A \in A^{1\tau}, B \in A^{1\rho} \). We say that \( A \) satisfies the intersection property with respect to \( B \) or shortly \( \text{ip}(A, B) \) iff either

1. \( B \in pc(A) \), or

2. \( A \in pc(B) \), or
3. $A \notin pc(B), B \notin pc(A), \rho = \tau$ and then there are pairwise different ordinals $\eta_1, ..., \eta_n \in s \setminus \rho$ and sets $A_1 \in \mathcal{A}^{\eta_1} \cap pc(A), ..., A_n \in \mathcal{A}^{\eta_n} \cap pc(A), A' \in \mathcal{A}^{\rho} \cap pc(A)$ such that
   
   $$A \cap B = A' \cap A_1 \cap ... \cap A_n,$$

   or

4. $A \notin pc(B), B \notin pc(A), \rho > \tau$ and then there are pairwise different ordinals $\eta_1, ..., \eta_n \in s \setminus \rho$ and sets $A_1 \in \mathcal{A}^{\eta_1} \cap pc(A), ..., A_n \in \mathcal{A}^{\eta_n} \cap pc(A)$ such that

   $$A \cap B = A \cap A_1 \cap ... \cap A_n.$$

If $\rho = \tau$, then let $ipb(A, B)$ denotes that both $ip(A, B)$ and $ip(B, A)$ hold.

Unfortunately such defined intersection property may break down already at gap 4, as shows an example below.

**An example of a failure of the intersection property $ip$ at gaps above 3.**

Let $X_0, X_1, X$ be a $\Delta$-system triple with witnessing model $F_0 \in X_1$, i.e. $X_1 \cap X_0 = X_1 \cap F_0$. Assume that $X_0 \in F_0$. Suppose that $F_0$ is a part of of an other $\Delta$-system type triple $F_0, F_1, F$. Let $G_0 \in F_0$ be such that $F_1 \cap F_0 = F_0 \cap G_0$.

Assume that $F_0, F_1, F \in X_1$ and $F_0, F, X, X_0, G_0$ are on the central lines. Suppose finally that $C[X]|(X_1) \setminus \{X_1\}$ has (or consists only of) a model $A_1$ such that $A_1$ is above $F$ (i.e. $sup(A_1) > sup(F)$), $G_0 \in A_1$, but $F \notin A_1$.

Note that in this case $(A_1)|_{F_1}$ should exist.

Set $A_0 = \pi_{X_1, X_0}(A_1)$ and $A = \pi_{F_0, F_1}(A_0)$.

We claim that $ip(X_1, A)$ fails. First note that $A \cap |X|^+ = A_0 \cap |X|^+ = A_1 \cap |X|^+$ and $A_1 \cap |X|^+ < X_1 \cap |X|^+$, since $A_1 \in X_1$. So, if $ip(X_1, A)$ holds then $A_1$ should be one of the models intersection of which witnesses $ip(X_1, A)$, since there is no other models in $X_1$ of cardinality $|X|$.

Consider $A_1 \cap A$. Clearly $A_1 \cap A = A_1 \cap A \cap F$. Remember that $F, F_0$ are on the central line, this central line remains such in $A_1$ (just $C[F]|((A_1)|_{F_1})$) and $F \notin A_1$. So $A_1 \cap F = A_1 \cap F_0$.

Now $A \cap F_0 = A_0 \cap F_0 \cap F_1$. Hence we have

$$X_1 \cap A \subseteq A_1 \cap A = A_1 \cap A_0 \cap F_0 \cap F_1 = A_1 \cap F_0 \cap F_1,$$

since $A_1 \cap A_0 = A_1 \cap F_0$.

Note that $X_1 \cap A = \pi_{F_0, F_1}[A_1 \cap F_0]$, since $\pi_{F_0, F_1} \in X_1$ and so

$$z \in X_1 \cap A \iff \pi_{F_1, F_0}(z) \in X_1 \cap A_0 = A_1 \cap F_0.$$
We have $G_0 \in (A_1 \cap F_0) \setminus F_1$. Then $\pi_{F_0,F_1}(G_0) \not\in F_0$, but it is in $X_1 \cap A$ and $X_1 \cap A \subseteq A_1 \cap F_0 \cap F_1$. Contradiction.

It is possible to have $|A| > |X_1|$ as well here.

We define now and use a weaker notion $wip$.

**Definition 2.3.2** Let $A \in A^{1\tau}$. Denote by $pwc_0(A)$ (0-piste connected) the set of all intersections of the form

$$E_0 \cap \ldots \cap E_n$$

such that $n < \omega$ and for each $i \leq n$, $E_i \in pc((A)_\eta) \cap A$ for some $\eta_i \in s \cap A \setminus \tau$.

Set

$$pc_1(A) = \{ \pi_{F_0,F_1}[E] \mid \text{for some } \rho \in s \cap A \setminus \tau + 1 \text{ there is } F \in A \cap pc((A)_\rho) \text{ such that the triple}$$

$$F_0, F_1, F \text{ is of a } \Delta \text{-system type, } E \in pwc_0(A) \text{ and } (E \in F_0 \text{ or } E \subseteq F_0) \}.\$$

Then we take intersections again, i.e. set

$$pwc_2(A) = \{ E_0 \cap \ldots \cap E_n \mid n < \omega, \text{ for each } i \leq n \ E_i \in pwc_0(A) \cup pwc_1(A) \}.\$$

Continue the definition further by induction taking intersections at even stages and images under $\Delta$-systems isomorphisms at odd stages.

Finally define the set $wpc(A)$ (weakly piste connected) to be

$$\bigcup_{n<\omega} pwc_n(A).$$

Note that $A \supseteq wpc(A)$. Also if $ip(A,B)$, then $A \cap B \in wpc(A)$.

**Definition 2.3.3** Let $\langle \langle A^{0\xi}, A^{1\xi}, C^\xi \mid \xi \in s \rangle \rangle \in P', \tau \leq \rho$ and $A \in A^{1\tau}, B \in A^{1\rho}$. We say that $A$ satisfies the weak intersection property with respect to $B$ or shortly $wip(A,B)$ iff

$$A \cap B \in wpc(A).$$

If $\rho = \tau$, then let $wipb(A,B)$ denotes that both $wip(A,B)$ and $wip(B,A)$ hold.

The proof of the next lemma just repeats the proof of the intersection lemma of gap 3 of Chapter 1.

**Lemma 2.3.4** Let $\langle \langle A^{0\tau}, A^{1\tau}, C^\tau \mid \tau \in s \rangle \rangle \in P', \tau \in s, A, B \in bp(A^{0\tau})$. Then $ipb(A,B)$.

In the general case the following holds:
Lemma 2.3.5 Let $\langle \langle A^{0}, A^{1}, C^{*} \rangle \mid \tau \in s \rangle \rangle \in \mathcal{P}^{\ast}, \tau_{1}, \tau_{2} \in s, A \in A^{1}, B \in A^{1}. \text{ Then} $

1. $\tau_{1} < \tau_{2}$ implies $\text{wip}(A, B)$,

2. $\tau_{1} = \tau_{2}$ implies $\text{wipb}(A, B)$.

Proof. Without loss of generality we can assume that $B \in A^{0}$, just otherwise extend the condition $\langle \langle A^{0}, A^{1}, C^{*} \rangle \mid \tau \in s \rangle \rangle$. Consider the pistes from $A^{0}$ leading to $A$ and to $B$. Let $X$ be the least common point of this pistes using only the first continuation. $X$ must be a successor point.

Case 1. There are $X_{0}, X_{1} \in X \cap A^{1}[X]$ such that the triple $X_{0}, X_{1}, X$ is a triple of a $\Delta$-system type, and say the piste to $A$ continues via $X_{0}$ and those to $B$ via $X_{1}$.

Set $A_{1} = \pi_{X_{0}, X_{1}}[A]$. Let $F_{0} \in X_{0}, F_{1} \in X_{1}$ be the models witnessing that $X_{0}, X_{1}, X$ is a $\Delta$-type triple.

Then

$$A \cap B = A \cap X_{0} \cap B \cap X_{1} = (A \cap F_{0}) \cap (A_{1} \cap B) = (A_{1} \cap F_{1}) \cap (A_{1} \cap B).$$

Apply the induction to $A_{1}, B$. Then we will have $A_{1} \cap B \in wpc(A_{1})$. Let $E_{1}$ be a description of $A_{1} \cap B$ inside $wpc(A_{1})$. Denote by $E$ the image of $E_{1}$ under $\pi_{X_{0}, X_{1}}$. Then $E$ will be a description in $wpc(A)$ and $F_{0} \cap E = F_{1} \cap E_{1}$, by the elementarity of $\pi_{X_{0}, X_{1}}$. Apply the induction to $A \cap F_{0}$. Then we will have $A \cap F_{0} \in wpc(A_{1})$ and $E \in wpc(A)$, hence the intersection will be in $wpc(A)$ as well. So $A \cap B \in wpc(A)$.

Case 2. There are $\rho^{0}, \rho^{1} \in (s \setminus \tau) \cap X, T^{0} \in C^{\rho^{0}}((X)_{\rho^{0}}) \cap X, T^{1} \in C^{\rho^{1}}((X)_{\rho^{1}}) \cap X$ such that the continuation of the piste to $A$ splits from $T^{0}$ and those to $B$ from $T^{1}$.

Let $T_{0}, T_{1}$ be the splitting, i.e. $T^{i}, T_{0}^{i}, T_{1}^{i}$ form a $\Delta$-system with $T_{0}^{i}$ on the central line, where $i \in 2$.

We do not exclude the possibility that $T^{0} = X$ or $T^{1} = X$.

Assume that $\sup(T^{0}) < \sup(T^{1})$. Further we will always deal with $\text{wip}(B, A)$ once $|B| \leq |A|$, so there will be no need to consider separately also the case when $\sup(T^{0}) < \sup(T^{1})$.

Subcase 2.1. $T^{0} \not\subset T^{1}$.

Then necessarily, $|T^{1}| < |T^{0}|$. Consider $(T^{1})_{|T^{0}|}$. $T^{1}$ is on a central line so $T^{0} \in C^{\langle (T^{1})_{|T^{0}|} \rangle}$. Let $Z \in C^{\langle (T^{1})_{|T^{0}|} \rangle}$ be the least model above $T^{0}$ which belongs to $T^{1}$. Then

$$T^{1} \cap T^{0} = T^{1} \cap T_{0}^{0} = T^{1} \cap Z.$$

Now we have

$$A \cap B = A \cap T^{0} \cap T^{1} \cap B = A \cap T_{0}^{0} \cap B \cap T_{0}^{0} = B \cap A_{0} \cap G_{0},$$

64
where $A_0 = \pi_{T_0^0T_0^1}(A)$ and $G_0 \in T_0^0$ is a $\Delta$-system witness, i.e. $T_0^0 \cap T_1^0 = T_0^0 \cap G_0$. The induction applied to $B, A_0$ and $B, G_0$ gives $wip(B, A)$, once $\tau_1 = \tau_2$.

Let us deduce $wip(A, B)$. Apply the induction to $A_0, B$. There is a set $E_0 \in wpc(A_0)$ such that $A_0 \cap E_0 = A_0 \cap B$. So

$$A \cap B = A_0 \cap E_0 \cap G_0 = A \cap A_0 \cap E_0 \cap G_0.$$  

Set $G = \pi_{T_0^0T_1^1}(G_0)$ and let $E \in wpc(A)$ be the set which description (in the process of constructing $wpc(A)$) will be the image of the description of $E_0$. By elementarity $\pi_{T_0^0T_1^1}(E_0) = E$. The elementarity and the fact that $\pi_{T_0^0T_1^1}$ is the identity on $T_0^0 \cap T_1^0$ imply

$$z \in A \cap A_0 \cap E_0 \cap G_0 \iff z = \pi_{T_0^0T_1^1}(z) \in A \cap A_0 \cap E \cap G.$$  

So $A \cap A_0 \cap E_0 \cap G_0 = A \cap A_0 \cap E \cap G = A \cap E \cap G$. Apply the induction to $A, G$. We obtain $Y \in wpc(A)$ such that $A \cap A_0 \cap E \cap G = Y$. Then also $A \cap B = Y$ and we are done.

**Subcase 2.2.** $T^0 \in T^1$.

**Sub-Subcase 2.2.1.** $T^0 \in T_0^1$.

Then we just repeat the argument of Case 1.

**Sub-Subcase 2.2.2.** $T^0 \not\in T_0^1$ and $T^0 \not\in T_1^1$.

Note that $(T_1^1)_{T^0}$ is on the central line of $|T^0|$, since $|T^1| < |T^0|$ and $T_0^1, T_1^1, T^1$ is a $\Delta$-system triple. If $T^0 \in (T_1^1)_{T^0}$, then as in Sub-Subcase 2.1.1 we have

$$T_1^1 \cap T^0 = T_1^1 \cap T_0^0 = T_1^1 \cap Z,$$

where $Z \in C_{|T^0|}((T_1^1)_{T^0})$ is the least model above $T^0$ which belongs to $T_1^1$. The argument of Sub-Subcase 2.1.1 applies now.

Suppose that $T^0 \not\in (T_1^1)_{T^0}$, then $(T_1^1)_{T^0} \in T^0$. Then also $(T_1^1)_{T^0} \in T_0^0$. This implies $T_1^1 \in T_0^0$. Hence

$$A \cap B = B \cap T_1^1 \cap T_0^0 \cap A = B \cap T_0^0 \cap A = B \cap A_0 \cap G_0,$$

where as before $A_0 = \pi_{T_0^0T_0^1}(A)$ and $G_0 \in T_0^0$ is a $\Delta$-system witness, i.e. $T_0^0 \cap T_1^0 = T_0^0 \cap G_0$.

Now we continue as in Sub-Subcase 2.1.1.

**Sub-Subcase 2.2.3.** $T^0 \not\in T_0^1$ and $T^0 \in T_1^1$.

**Sub-Sub-Subcase 2.2.3.1.** $T^0 \not\in T_0^1$ and $T^0 \in B$.

Let us show first $wip(B, A)$, once it makes sense. Apply the induction to $B, A_0$. Let $E \in wpc(B)$ be so that $B \cap A_0 = E$. Now, $T^0 \in B$ implies that $T_0^0, T_1^0 \in B$ and also $\pi_{T_0^0T_1^1} \in B$. Then

$$z \in A \cap B \iff \pi_{T_1^0T_0^1}(z) \in A_0 \cap B = E.$$  

65
Set \( E' = \pi_{T_0^0 T_1^1}^0(E) \). Clearly, \( E' \in \text{wpc}(B) \) and \( A \cap B = E' \), which means \( \text{wip}(B, A) \).

Turn now to \( \text{wip}(A, B) \). Let us apply the induction to \( A_0, B \) and find \( E_0 \in \text{wpc}(A_0) \) such that \( B \cap A_0 = E_0 \). Set \( E = \pi_{T_0^0 T_1^1}(E_0) \). Then \( E \in \text{wpc}(A) \). We claim that \( A \cap B = E \). Thus

\[
    z \in A \cap B \iff \pi_{T_0^0 T_1^1}(z) \in A_0 \cap B = E_0 \iff z \in E.
\]

**Sub-Sub-Subcase 2.2.3.2.** \( T^0 \notin T_0^1 \) and \( T^0 \notin B \).

Consider \((B)_{|T^0|}\). If \( T^0 \in (B)_{|T^0|} \), then the argument of Sub-Sub-Subcase 2.1.2.2 works here.

If \((B)_{|T^0|} \neq \emptyset \) and \((B)_{|T^0|} \in T^0 \), then \( B \in T^0 \). This implies that \( B \in T_0^0 \) or \( B \in T_1^0 \), since between models forming a \( \Delta \)-system there is no models of a small cardinality. Now if \( B \in T_0^0 \), then we apply the induction to \( A_0, B \). So there is \( E_0 \in \text{wpc}(A_0) \) such that \( A_0 \cap B = E_0 \). Set \( E = \pi_{T_0^0 T_1^1}(E_0) \) and let \( G_1 \in T_1^0 \) be such that \( T_0^0 \cap T_1^0 = T_1^0 \cap G_1 \). Then

\[
    A \cap B = A \cap T_0^0 \cap B = A \cap A_0 \cap G_1 \cap B = A \cap E \cap G_1,
\]

and we are done.

If \( B \in T_1^0 \), then consider \( B_0 = \pi_{T_1^0 T_0^0}(B) \). It is simpler than \( B \), since \( T_0^0 \) on the central line. Apply the induction to \( A_0, B_0 \) and then move the result back by \( \pi_{T_1^0 T_0^0} \).

Suppose now that \( T^0 \in (B)_{|T^0|} \) and \((B)_{|T^0|} \notin T^0 \) or \((B)_{|T^0|} = \emptyset \) but \( B \notin T^0 \). Then the piste from \( T_1^0 \) must split at some point of cardinality \( \geq |T^0| \) above \( T^0 \). Let \( S \) be such point and \( S_0, S_1 \) its immediate predecessors forming a \( \Delta \)-system with \( S_0 \) on the central line and \( B \in S_1 \). Now \( S_0 \supseteq T^0 \), hence

\[
    A \cap B = A \cap S_0 \cap S_1 \cap B = A \cap B_0 \cap M_0,
\]

where \( B_0 = \pi_{S_1 S_0}(B) \) and \( M_0 \in S_0 \) is such that \( S_0 \cap S_1 = S_0 \cap M_0 \). Apply the induction to \( A, B_0 \) and \( A, M_0 \). This shows \( \text{wip}(A, B) \). The property \( \text{wip}(B, A) \), when applies, can be shown by using in addition \( \pi_{S_0 S_1} \).

### 2.4 Suitable structures and assignment functions—beyond 3

We address first the new splitting possibility, which is crucial for GCH and does not appear in the gap 2, 3 cases.

**Definition 2.4.1** Let \( \nu < \xi < \mu \) be cardinals, \( A, X, Y_0, Y_1, Y \) be models, \( C_\nu \subseteq \mathcal{P}_{\nu^+}(H(\theta^+)) \), \( C_\xi \subseteq \mathcal{P}_{\xi^+}(H(\theta^+)) \). We call triples \( F_0, F_1, F \) and \( A_0', A_0, A_1 \) splitting triples over \( A, X, Y_0, Y_1, Y \) inside \( C_\nu, C_\xi \) iff
1. $|A_0| = \nu$, 
2. $|Y_0| = \xi$, 
3. $|X| = \mu$, 
4. $A_0, A'_0, A_1 \in C_\nu$, 
5. $Y_0, Y_1, Y, F_0, F_1, F \in C_\xi$, 
6. $F_0, F_1 \in F$,
7. $F_0, F_1$ are isomorphic over $F_0 \cap F_1$,
8. $F_0, F_1, F \in A_1$,
9. $X \in F_1$,
10. $F_0 \cap F_1 = F_1 \cap X$,
11. $A_0 \in F_0$,
12. $A_1 \cap A_0 = A_1 \cap F_0$,
13. $A_1, A_0$ are isomorphic over $A_1 \cap A_0$,
14. $A'_0 = \pi_{F_0,F_1}(A_0)$,
15. $A \subseteq A'_0$,
16. $Y_0 = \pi_{F_0,F_1}(\pi_{A_1,A_0}(F_0)), Y_1 = \pi_{F_0,F_1}(\pi_{A_1,A_0}(F_1)), Y = \pi_{F_0,F_1}(\pi_{A_1,A_0}(F))$.

Note that $A_0 \cap A_1 = A_0 \cap \pi_{A_1,A_0}(F_0)$, since $\alpha \in A_0 \cap A_1$ iff $\alpha \in A_1 \cap F_0$ iff $\pi_{A_1,A_0}(\alpha) \in A_0 \cap \pi_{A_1,A_0}(F_0)$, but for $\alpha \in A_0 \cap A_1, \pi_{A_1,A_0}(\alpha) = \alpha$.

Then $A'_0 \cap A_1 = A_1 \cap F_1 = A'_0 \cap Y_0$, since $\pi_{F_1,F_0} \in A_1$. Hence $Y$ is a model which corresponds to $F_0$ in $A'_0$.

Normally, we will have $|A_0| < |F|$ and $|X| = |F|^\ast$.

**Lemma 2.4.2** Suppose that all the models of Definition 2.4.1 are members of a condition in $\mathcal{P}'$. Then $Y_0 \in A$ implies $Y_1, Y, X \in A$. 

67
Proof. Set $A_1^* = \pi_{A_0,A_1}(\pi_{F_1,F_0}(A))$. If $Y_0 \in A$, then $\pi_{F_1,F_0}(Y_0) \in \pi_{F_1,F_0}(A)$, and hence $\pi_{A_0,A_1}(\pi_{F_1,F_0}(Y_0)) = F_0 \in A_1^*$. Then $F \in A_1^*$, since there are no models of small cardinality between $F_0$ and $F$. Hence, $F_1 \in A_1^*$. So, their pre-images $Y$ and $Y_1$ are in $A$.

Now, there is $G_0 \in F_0 \cap A_1^*$ such that $F_0 \cap F_1 = F_0 \cap G_0$. Then $G_0 \in A_1 \cap F_0 = A_0 \cap A_1$. Moreover, $G_0 \in A_1^* \cap F_0 = A_0^* \cap A_1^*$, where $A_0^* = \pi_{F_1,F_0}(A)$.

Set $G_1 = \pi_{F_0,F_1}(G_0)$. Then $G_1 \in A \cap A_1^*$ and $F_0 \cap F_1 = F_1 \cap G_1$, i.e. $G_1 = X$ and $X \in A$.

□

**Lemma 2.4.3 (Existence of splitting triples).** Let $\mu > \xi > \nu$ be regular cardinals in $[\kappa^+, \theta]$. Then for every closed unbounded sets $C_\nu \subseteq P_{\nu^+}(H(\theta^+))$, $C_\xi \subseteq P_{\xi^+}(H(\theta^+))$ there is a closed unbounded $C_\mu \subseteq P_{\mu^+}(H(\theta^+))$ such that for every model $X \in C_\mu$, with $^{\xi}X \subseteq X$, there are $Y_0, Y_1, Y \in C_\xi$, $^{\nu}Y_0 \subseteq Y_0$, $^{\nu}Y_1 \subseteq Y_1$, $^{\nu}Y \subseteq Y$ so that for every model $A$ with $|A| \leq \nu$ there are splitting triples over $A \subseteq X, Y_0, Y_1, Y$ inside $C_\nu, C_\xi$.

Proof. Suppose otherwise. Then there are clubs $C_\nu \subseteq P_{\nu^+}(H(\theta^+)), C_\xi \subseteq P_{\xi^+}(H(\theta^+))$ such that for every club $C_\mu \subseteq P_{\mu^+}(H(\theta^+))$ there is a model $X \in C_\mu$ so that for every models $Y_0, Y_1, Y \in C_\xi$ there is a model $A(X, Y_0, Y_1, Y)$ without splitting triples over $A(X, Y_0, Y_1, Y), X, Y_0, Y_1, Y$ inside $C_\nu, C_\xi$.

Let $C_\nu \subseteq P_{\nu^+}(H(\theta^+)), C_\xi \subseteq P_{\xi^+}(H(\theta^+))$ be such clubs. Define a function

$$I : \mu^+ \times C_\xi \times C_\xi \times C_\xi \rightarrow P_{\nu^+}(H(\theta^+))$$

by setting $I(X, Y_0, Y_1, Y)$ to be the least model $A \in P_{\nu^+}(H(\theta^+))$ without splitting triples over $A(X, Y_0, Y_1, Y), X, Y$ inside $C_\nu, C_\xi$, if there is one and 0 otherwise.

Fix functions $h_\nu : [H(\theta^+)]^{<\omega} \rightarrow P_{\nu^+}(H(\theta^+)), h_\xi : [H(\theta^+)]^{<\omega} \rightarrow P_{\xi^+}(H(\theta^+))$ such that

$$C_\nu \supseteq \{t \in P_{\nu^+}(H(\theta^+)) \mid h_\nu(e) \subseteq t \text{ whenever } e \in [t]^{<\omega}\}$$

$$C_\xi \supseteq \{t \in P_{\xi^+}(H(\theta^+)) \mid h_\xi(e) \subseteq t \text{ whenever } e \in [t]^{<\omega}\}.$$ 

Turn to submodels of $\langle H(\lambda^+), \in, <, \theta^+, h_\nu, h_\xi, I \rangle$ for $\lambda$ much bigger than $\theta$. Consider

$$C = \{Z \in P_{\mu^+}(H(\lambda^+)) \mid Z \prec \langle H(\lambda), \in, <, \theta^+, h_\nu, h_\xi, I \rangle\}.$$ 

Then

$$C \upharpoonright H(\theta^+) = \{Z \cap H(\theta^+) \mid Z \in C\}$$

contains a club in $P_{\mu^+}(H(\theta^+))$. Let $C_\mu$ be such a club. Pick $X \in C_\mu, \xi \subseteq X$, to be a counterexample.
Find $X^* \in C$ with $X^* \cap H(\theta^+) = X$. Note that $X^*$ may be not closed under $\xi$-sequences of its elements (even sup($X^* \cap \theta^+$) can have cofinality $\omega$).

Let $F_1^* \prec \langle H(\lambda^+), \xi, <, \theta^+, h_\nu, h_\xi, I \rangle$ be a model of cardinality $\xi$, closed under $\nu$-sequences of its elements and with $X^*$ inside. Then $F_1 = F_1^* \cap H(\theta^+)$ is closed under $h_\xi$ and hence $F_1 \in C_{\xi}$. Let $F_0^*$ be obtained from $F_1^*$ via a reflection to $X^*$. Here $F_1^* \cap X^*$ need not be an element of $X^*$ due the possible lack of closure, but $F_1 = F_1^* \cap H(\theta^+)$ is in $X = X^* \cap H(\theta^+$), since $\xi X \subseteq X$. We pick $F_0^* \prec \langle H(\lambda^+), \xi, <, \theta^+, h_\nu, h_\xi, I \rangle$ to be a model realizing the same type as $F_1^*$ over $F_1 \cap X$. So $F_1^*, F_0^*$ are isomorphic by the isomorphism which is the identity over $F_1 \cap X$, but probably not the identity over $F_1^* \cap F_0^*$.

Let $F^* \prec \langle H(\lambda^+), \xi, <, \theta^+, h_\nu, h_\xi, I \rangle$ be a model with $F_0^*, F_1^*$ inside and closed under $\nu$-sequences of its elements. Pick now $A_1^* \prec \langle H(\lambda^+), \xi, <, \theta^+, h_\nu, h_\xi, I \rangle$ to be a model of cardinality $\nu$ with $F_0^*, F_1^*, F^*, X^* \in A_1^*$. Reflect $A_1^*$ to $F_0^*$. Let $A_0^* \subseteq F_0^* \cap H(\lambda^+)$ be a result. Then $A_0^* \prec \langle H(\lambda^+), \xi, <, \theta^+, h_\nu, h_\xi, I \rangle$, the isomorphism $\pi_{A_1^* \cap H(\lambda^+), A_0^*}$ is the identity on $A_1^* \cap H(\theta^+) \cap A_0^*$ and $A_1^* \cap H(\theta^+) \cap F_0^* = A_1^* \cap A_0^* \cap H(\theta^+)$. Set $A_0^* = \pi_{F_0^*, F_1^* \cap H(\lambda^+)}(A_0^*)$. Then, $A_0^* \prec \langle H(\lambda^+), \xi, <, \theta^+, h_\nu, h_\xi, I \rangle$, since $A_0^* \cap F_0^* \cap H(\lambda^+)$ and $F_0^* \simeq F_1^* \cap H(\lambda^+)$. This implies in particular that $A_0^* = A_0^* \cap H(\theta^+)$ is in $C_\nu$ and $A_0^*$ is closed under $I$.

Set $F_0^{0*} = \pi_{A_1^* \cap H(\lambda^+), A_0^*}(F_0^* \cap H(\lambda^+))$, $F_1^{0*} = \pi_{A_1^* \cap H(\lambda^+), A_0^*}(F_1^* \cap H(\lambda^+))$ and $F^{0*} = \pi_{A_1^* \cap H(\lambda^+), A_0^*}(F^* \cap H(\lambda^+))$. Move this models to $A_0^*$. Thus let $Y_0^{*} = \pi_{F_0^{0*}, F_1^{0*} \cap H(\lambda^+)}(F_0^{0*})$, $Y_1^{*} = \pi_{F_0^{0*}, F_1^{0*} \cap H(\lambda^+)}(F_1^{0*})$ and $Y^{*} = \pi_{F_0^{0*}, F_1^{0*} \cap H(\lambda^+)}(F^{0*})$. Then $Y_0^{*}, Y_1^{*}, Y^{*} \in A_0^*$.

Define $F_0 = F_0^* \cap H(\theta^+), F_1 = F_1^* \cap H(\theta^+), F = F^* \cap H(\theta^+), Y_0 = Y_0^* \cap H(\theta^+), Y_1 = Y_1^* \cap H(\theta^+), Y = Y^* \cap H(\theta^+)$. Then $X, Y_0, Y_1, Y \in A_0^*$, since $X \in A_1^* \cap F_1 = A_1 \cap A_0^*$ (the last equality holds because $A_1 \cap F_0 = A_1 \cap A_0$ and $\pi_{F_0^*, F_1^*} \in A_1$). The models $A_0^*, A_0, A$ are in $C_\nu$, since they are closed under $h_\nu$. Similar $F_0, F_1, F, Y_0, Y_1, Y \in C_\xi$. Finally, $A_0^*$ is closed under $I$ and $X, Y_0, Y_1, Y \in A_0^*$, hence $I(X, Y_0, Y_1, Y) \in A_0^*$. By the choice of $X, Y_0, Y_1, Y$, $I(X, Y_0, Y_1, Y)$ must be a model without splitting triples over $I(X, Y_0, Y_1, Y), X, Y_0, Y_1, X$ inside $C_\nu, C_\xi$. But $F_0, F_1, F \in C_\xi$ and $A_0^*, A_0, A_1 \in C_\nu$ are splitting triples over $I(X, Y_0, Y_1, Y), X, Y_0, Y_1, Y$. Contradiction.

□

**Lemma 2.4.4** Suppose that $X, Y_0, Y_1, Y$ satisfy the conclusion of Lemma 2.4.3 and they are in $M$ for a model $M \in C_\nu$. Then there are splitting triples $A_0^*, A_0, A_1, F_0, F_1, F$ over $M, X, Y_0, Y_1, Y$ with $A_0^* = M$. 
Definition 2.4.6

$π$ for each

So, we can replace

Definition 2.4.5

$\tau$ if there is

Definition 2.4.7

suitable structure if there is

if $µ$ is a limit cardinal, then

if $µ$ is a successor cardinal, then let $C_µ$ be the intersection of the clubs given by Lemma 2.4.3 for each $ν < ξ < µ$.

Definition 2.4.5 A model $M$ of a regular cardinality $ν$ is called a reliable model if

1. $M \cap H(θ+) ∈ C_ν$, 

2. for every regular cardinals $ξ, µ ∈ M, ν < ξ < µ$, for every clubs $E ⊆ P_ν+(H(θ+)), D ⊆ P_ξ+(H(θ+))$ in $M$ and there is a club $C ⊆ P_µ+(H(θ+)), C ⊆ C_µ, C ∈ M$ such that for every $X ∈ C ∩ M$ there are $Y₀, Y₁, Y ∈ D ∩ M$ which satisfy the conclusion of Lemma 2.4.3 with $E$ and $D$.

Definition 2.4.6 A structure $X = \langle X, E, C ∈, \subseteq \rangle$, where $E ⊆ [X]^2$ and $C ⊆ [X]^3$ is called suitable structure if there is $p(X) = \langle A^{0r}(X), A^{1τ}(X), C^r(X) \rangle | τ ∈ s(X) ∈ P'$ such that

1. $X = A^{0r}(X)$,

2. $s(X) ∈ X$,

3. $s(X) ⊆ X$,

4. $⟨a, b⟩ ∈ E$ iff $a ∈ s(X)$ and $b ∈ A^{10}(X)$,

5. $⟨a, b, d⟩ ∈ C$ iff $a ∈ s(X), b ∈ A^{1a}(X)$ and $d ∈ C^a(X)(b)$.

Let $G(P')$ be a generic subset of $P'$.

Definition 2.4.7 A suitable structure $X = \langle X, E, C ∈, \subseteq \rangle$ is called suitable generic structure if there is $\langle A^{0r}, A^{1τ}, C^r \rangle | τ ∈ s \rangle ∈ G(P')$ such that

70
1. \( \langle A^0\tau, A^1\tau, C^\tau \mid \tau \in s \setminus \{\kappa^+\} \rangle \in A^{0\kappa^+} \).

In particular \( s \in A^{0\kappa^+} \). Note that \( s \) may have cardinality above \( \kappa^+ \) (which is not a case in a suitable structure) and so \( s \) not necessary is contained in \( A^{0\kappa^+} \).

2. \( \mathfrak{X} \) is a substructure (not necessarily elementary) of the suitable structure generated by \( \langle A^0\tau, A^1\tau, C^\tau \mid \tau \in s \rangle \), i.e. \( \langle A^{0\kappa^+}, \{\tau, B \mid \tau \in s, B \in A^1\tau\}, \{\tau, B, D \mid \tau \in s, B \in A^1\tau, D \in C^\tau(B)\} \rangle \).

3. \( X \in C^{\kappa^+}(A^{0\kappa^+}) \).

4. \( p(\mathfrak{X}) \) and \( \langle A^0\tau, A^1\tau, C^\tau \mid \tau \in s \rangle \) agree about the pistes to members of \( X \cap \bigcup \{A^1\tau \mid \tau \in s\} \). In other words we require that all the elements of pistes in \( \langle A^0\tau, A^1\tau, C^\tau \mid \tau \in s \rangle \) to elements of \( X \cap \bigcup \{A^1\tau \mid \tau \in s\} \) are in \( X \).

5. If \( A \in A^1\tau(\mathfrak{X}) \), for some \( \tau \in s(\mathfrak{X}) \), then either \( A \) it is of one of the first three types of Definition 2.2.4(2) inside \( \langle A^0\tau, A^1\tau, C^\tau \mid \tau \in s \rangle \) or the models witnessing that it is of the forth type appear in \( \mathfrak{X} \) as well.

Note that, as a condition in \( P' \), \( p(\mathfrak{X}) \) need not be weaker than \( \langle A^0\tau, A^1\tau, C^\tau \mid \tau \in s \rangle \), and hence it need not be in \( G(P') \).

Note also, that any stronger condition \( \langle B^0\tau, B^1\tau, D^\tau \mid \tau \in r \rangle \in G(P) \) such that

- \( \langle B^0\tau, B^1\tau, D^\tau \mid \tau \in r \setminus \{\kappa^+\} \rangle \in B^{0\kappa^+} \),

and

- \( C^\tau(A^0\tau) \) is an initial segment of \( D^\tau(B^0\tau) \), for each \( \tau \in s \)

will witness that \( \mathfrak{X} \) is a suitable generic structure.

Fix \( n < \omega \). We define an analog \( P'_n \) of \( P' \) on the level \( n \) just replacing \( \kappa \) by \( \kappa^{+n} \) and \( \theta \) by some \( \lambda_n \) big enough (\( \lambda_n \) a Mahlo will be more than enough; we can use for the gap 4 case \( \lambda_n = \kappa^{+n+4} \), etc). An assignment function \( a_n \) will be an isomorphism between a suitable generic structure of cardinality less than \( \kappa_n \) over \( \kappa \) and a suitable structure over \( \kappa^{+n} \).

Define \( Q_{n0} \).

**Definition 2.4.8** Let \( Q_{n0} \) be the set of the triples \( \langle a, A, f \rangle \) so that:

1. \( f \) is partial function from \( \theta^+ \) to \( \kappa_n \) of cardinality at most \( \kappa \)

2. \( a \) is an isomorphism between a suitable generic structure \( \mathfrak{X} \) of cardinality less than \( \kappa_n \) and a suitable structure \( \mathfrak{X}' \) in \( P'_n \) so that
(a) every model in \( X' \) is a reliable model,

(b) \( X' \) is above every model which appears in \( A^{1\tau}(X') \) for some \( \tau \in s(X') \setminus \{ \kappa^+ \} \) and also those in \( A^{1\kappa^+}(X') \setminus \{ X' \} \) in the order \( \leq_{E_n} \) of the extender \( E_n \), (or actually, after coding \( X' \) by an ordinal),

(c) if \( t \in \bigcup \{ A^{1\tau}(X') \mid \tau \in s(X') \} \), then for some \( k, 2 < k < \omega \),

?!t \prec H(\chi^k), with \( \chi \) big enough fixed in advance. (Alternatively, may be to work with subsets of \( \lambda_n \) only and further require it is a restriction of such model to \( \lambda_n \).) We deal with elementary submodels of \( H(\chi^k) \), instead of those of \( H(\lambda_n) \).

Further passing from \( Q_{n0} \) to \( P \) we will require that for every \( k < \omega \) for all but finitely many \( n \)’s the \( n \)-th image of a model \( t \in X \cup Y \) will be an elementary submodel of \( H(\chi^k) \).

The way to compare such models \( t_1 \prec H(\chi^{k_1}), t_2 \prec H(\chi^{k_2}) \), when \( k_1 \neq k_2 \), say \( k_1 < k_2 \), will be as follows:

move to \( H(\chi^{k_1}) \), i.e. compare \( t_1 \) with \( t_2 \cap H(\chi^{k_1}) \).

3. \( A \in E_{n,X'} \),

4. for every ordinals \( \alpha, \beta, \gamma \) which code models in \( \bigcup \{ A^{1\tau}(X') \mid \tau \in s(X') \} \) we have

\[
\alpha \geq_{E_n} \beta \geq_{E_n} \gamma \quad \text{implies} \quad \pi_{E_n}^{\alpha\gamma}(\rho) = \pi_{E_n}^{\beta\gamma}(\pi_{E_n}^{\alpha\beta}(\rho))
\]

for every \( \rho \in \pi_{X',\alpha}^\ast(A) \).

Define a partial order on \( Q_{n0} \) as follows.

**Definition 2.4.9** Let \( \langle a, A, f \rangle \) and \( \langle b, B, g \rangle \) be in \( Q_{n0} \). Set \( \langle a, A, f \rangle \geq_{n0} \langle b, B, g \rangle \) iff

1. \( a \supseteq b \),

2. \( f \supseteq g \),

3. \( \pi_{\max(\text{rng}(a)),\max(\text{rng}(b))}^{\ast}A \subseteq B \),

4. \( \text{dom}(f) \cap Y^b = \text{dom}(g) \cap Y^b \), where \( Y^b \) is the second component (i.e. the set of ordinals) of the suitable structure on which \( b \) is defined.

Note that here we do not require disjointness of the domain of \( g \) and of \( Y^b \), but as it will follow from the further definition of non-direct extension, the value given by \( g \) will be those that eventually counts.
Definition 2.4.10 \( Q_{n1} \) consists of all partial functions \( f : \kappa^{+3} \to \kappa_n \) with \( |f| \leq \kappa \). If \( f, g \in Q_{n1} \), then set \( f \geq_{n1} g \) iff \( f \supseteq g \).

Definition 2.4.11 Define \( Q_n = Q_{n0} \cup Q_{n1} \) and \( \leq_n^* = \leq_{n0} \cup \leq_{n1} \).

Let \( p = (a, A, f) \in Q_{n0} \) and \( \nu \in A \). Set
\[
p \triangledown \nu = f \cup \{ (\alpha, \pi_{\max(\text{rng}(a))}, a(\alpha)) | \alpha \in A^{1\theta}(\text{dom}(a)) \setminus \text{dom}(f) \}.
\]

Note that here \( a \) contributes only the values for \( \alpha \)'s in \( \text{dom}(a) \setminus \text{dom}(f) \) and the values on common \( \alpha \)'s come from \( f \). Also only the ordinals in \( A^{1\theta}(\text{dom}(a)) \) are used to produce non direct extensions, the rest of models disappear.

Now, if \( p, q \in Q_n \), then we set \( p \geq_n q \) iff either \( p \geq_n^* q \) or \( p \in Q_{n1} \), \( q = (b, B, g) \in Q_{n0} \) and for some \( \nu \in B \), \( p \geq_{n1} q \triangledown \nu \).

Definition 2.4.12 The set \( P \) consists of all sequences \( p = (p_n | n < \omega) \) so that

1. for every \( n < \omega \), \( p_n \in Q_n \),
2. there is \( \ell(p) < \omega \) such that
   a) for every \( n < \ell(p) \), \( p_n \in Q_{n1} \),
   b) for every \( n \geq \ell(p) \), we have \( p_n = (a_n, A_n, f_n) \in Q_{n0} \),
   c) there is \( \langle (A^{0\tau}, A^{1\tau}, C^{\tau}) | \tau \in s \rangle \in G(P') \) which witnesses that \( \text{dom}(a_n(p)) \) is a suitable generic structure (i.e. \( \text{dom}(a_n(p)) \) and \( \langle (A^{0\tau}, A^{1\tau}, C^{\tau}) | \tau \in s \rangle \) satisfy 2.4.7), simultaneously for every \( n, l(p) \leq n < \omega \).
3. For every \( n \geq m \geq \ell(p) \), \( \text{dom}(a_m) \subseteq \text{dom}(a_n) \),
4. for every \( n, \ell(p) \leq n < \omega \), and \( X \in \text{dom}(a_n) \) we have that for each \( k < \omega \) the set \( \{ m < \omega | \neg(a_m(X) \cap H(\chi^{+k}) \subset H(\chi^{+k})) \} \) is finite.] (Alternatively require only that \( a_m(X) \subseteq \lambda_m \) but there is \( \bar{X} \subset H(\chi^{+k}) \) such that \( a_m(X) = \bar{X} \cap \lambda_m \). It is possible to define being \( k \)-good this way as well).
5. for every \( n \geq \ell(p) \) and \( \alpha \in \text{dom}(f_n) \) there is \( m, n \leq m < \omega \) such that \( \alpha \in \text{dom}(a_m) \setminus \text{dom}(f_m) \).

Next lemma which allows to extend elements of \( P \) is crucial.

Lemma 2.4.13 Let \( p \in P \) and \( \langle (B^{0\tau}, B^{1\tau}, D^{\tau}) | \tau \in r \rangle \in G(P') \). Then
1. for every \( t \in \bigcup \{ B^{1r} \mid \tau \in r \} \) there is \( q \geq^* p \) such that \( t \in \text{dom}(a_n(q)) \) for all but finitely many \( n \)'s;

2. for every \( A \in B^{1x^+} \) there is \( q \geq^* p \) such that \( A \in \text{dom}(a_n(q)) \) for all but finitely many \( n \)'s. Moreover, if \( \langle (A^0r, A^{1r}, C^r) \mid \tau \in s \rangle \geq \langle (B^0r, B^{1r}, D^r) \mid \tau \in r \rangle \) witnesses a generic suitability of \( p \) and \( A \in C^{x^+}(A^{0x^+}) \), then the addition of \( A \) does not require adding of ordinals and the only models that probably will be added together with \( A \) are its images under \( \Delta \)-system type isomorphisms for triples in \( p \).

**Proof.** The proof follows the proof of this lemma in a gap 3 case. Let us concentrate on the new possibility of splitting. Namely given triples \( A_0', A_0, A_1 \in A \) and \( F_0, F_1, F \) as in the last case of Definition 2.2.4 with \( A_0', A \) and \( F_1, F \) on the central lines (other possibilities are as in a gap 3 case), we would like to add \( A_0, A_1, F_0 \). Denote by \( \hat{A} \) the largest model of \( C^{\|A\|}(A_0') \setminus \{ A_0' \} \) which is in \( p \), if such a model exists. Suppose that it exists. If it does not exist then the argument is similar and simpler. Consider \( X \in F_1 \cap A^{1[F_1]^r} \) such that \( F_0 \cap F_1 = F_1 \cap X \) and \( Y_0, Y_1, Y \in A^{1[F_1]^r} \) as in Definition 2.4.1. Then \( X, Y_0, Y_1, Y \in A_0' \). Using the induction we can assume that \( X \) already appears in \( p \). Now apply Lemma 2.4.3 to \( X^* = a_n(X) \) and appropriate \( C \) (\( C \) will depend on \( a_n(\hat{A}) \) and its place relatively to \( Y_0, Y_1, Y \)) and find models \( Y_0^*, Y_1^*, Y^* \) satisfying the conclusion of this lemma and which can be added to \( \text{rng}(a_n) \) as images of \( Y_0, Y_1, Y \). Assume that already \( a_n(Y_0) = Y_0^*, a_n(Y_1) = Y_1^* \) and \( a_n(Y) = Y^* \). Pick now inside \( A^* = a_n(A) \) splitting triples \( F_0^*, F_1^*, F^* \) and \( A_0^*, A_1^*, A_i^* \) over \( a_n(A_0'), X^*, Y_0^*, Y_1^*, Y^* \). By Lemma 2.4.4, we can assume that \( A^* = a_n(A_0') \). Add this models to \( \text{rng}(a_n) \) as images of the corresponding models over \( \kappa \). Finally extend \( a_n \) further by adding the images under isomorphisms corresponding to \( \Delta \)-system types.

We need the following property:

if \( A \in A^{0x^+} \cap \text{dom}(a_n) \), for some \( n \geq \ell(p) \) big enough, and \( B \in \text{max}(\text{dom}(a_n)) \) is a model which is reachable by a piste from \( A \), then

(1) it is possible to extend \( a_n \) to \( b_n \) by adding \( B \), probably in addition also models which belong to \( A \) and then taking isomorphic images.

(2) Let \( A \in \text{dom}(a_n) \), \( B \) a model added to \( \text{dom}(a_n) \) and \( \tilde{B} \) is an isomorphic image of \( B \) which belongs to \( A \), then \( b_n(\tilde{B}) \in a_n(A) \) as well all the models of the piste from \( A \) to \( \tilde{B} \), where \( b_n \) denotes the extension of \( a_n \) obtained by adding \( B \) and taking isomorphic images.
This means basically that for adding such $B$ we should take care only of models which are in $A$. The images of the rest of models with $B$ inside will have the image of $B$ inside automatically.

The proof is similar to the gap 3 case in Chapter 1 and uses intersection property of Chapter 2.3.

□

As in the Gap 3, we have the following:

**Lemma 2.4.14** \( \mathcal{P} \ast Q_{n_0} \) is \( \kappa_n \)-strategically closed.

**Lemma 2.4.15** \( \langle \mathcal{P}, \leq^* \rangle \) does not add new sequences of ordinals of the length \( \kappa_0 \).

**Lemma 2.4.16** \( \langle \mathcal{P}, \leq^* \rangle \) satisfies the Prikry condition.

Define \( \to \) on \( \mathcal{P} \) similar to those of [1] or [3].

**Lemma 2.4.17** \( \langle \mathcal{P}, \to \rangle \) satisfies \( \kappa^{++} \)-c.c.
Chapter 3

Preserving Strong Cardinals

We will need to make some minor changes in the previous settings made in Chapter 2. Thus, first it will be convenient to increase a bit a set of conditions by allowing to remove some maximal models (i.e. $A^{\alpha}_0$) from elements of $P'$. This way the original $P'$ will be dense in the new one, so from the forcing point of view nothing changes. Second, we like to deal with elementarity. In Chapter 2, we had $H(\theta)$ and considered its elementary submodels. But once embeddings $j : V \to M$ are around, $j(H(\theta)) = (H(j(\theta)))^M$ may differ from $H(\theta)$ even if $\theta$ is not moved. So being elementary in sense of $M$ will differ from being elementary in sense of $V$. We suggest below two ways to overcome this difficulty. The first one will be to assume that $\theta$ is a $2^\theta$-supercompact cardinal. Consider the following set

$$S = \{\alpha < \theta| \alpha \text{ is a superstrong cardinal with target } \theta\}$$

(i.e. there is $i : V \to M$, cri$(i) = \alpha$, $i(\alpha) = \theta$ and $M \supseteq V_\theta$).

It is stationary (actually of measure one for a normal measure over $\theta$), see for example Kanamori [15], 26.11.

Now, $V_\alpha \prec V_\theta$ for every $\alpha \in S$. Hence, $V_\alpha \prec V_\beta$ for every $\alpha < \beta$, $\alpha, \beta \in S$. Also the following holds:

Lemma 3.0.18 Let $\alpha \in S$ and $i : V \to N$ is an ultrapower by an $(\alpha, \nu)$-extender for some $\nu \leq \theta$. which is a part of superstrong $(\alpha, \theta)$-extender with target $\theta$. Then $V_\beta \prec (V_{i(\alpha)})^N$ for every $\beta \in S$, $\alpha \leq \beta < \nu$.

Proof. Let $j : V \to M$ be the ultrapower by a superstrong $(\alpha, \theta)$-extender with target $\theta$. This way
extending the used $(\alpha, \nu)$-extender. Then the following diagram is commutative

\[
\begin{array}{ccc}
  & M & \\
  j \downarrow & & \downarrow k \\
 V & \uparrow & \uparrow k \\
  i \downarrow & & \downarrow N \\
  & N & \\
\end{array}
\]

where $k$ is defined in the obvious fashion.

Now, $k((V_i(\alpha))^N) = V_j(\alpha) = V_\theta$. Also $k(\beta) = \beta$ and $V_\beta \prec V_\theta$. Hence, $V_\beta \prec (V_i(\alpha))^N$.

\[\square\]

Note also that by elementarity $(V_i(\alpha))^N \prec (V_i(\theta))^N = (V_\theta)^N$.

The second way will be to deal with just subsets (closed enough) and $\Sigma_1$ elementarity. Using this approach there will be no need in supercompacts cardinals- thus strongs alone suffice.

**Lemma 3.0.19** Suppose that $V_\delta \prec_{\Sigma_1} V_\theta$, $\alpha$ is $\delta$-strong and $j : V \to M$ be an elementary embedding such that

- $M \supseteq V_\delta$
- $j(\theta) = \theta$.

Then $V_\delta \prec_{\Sigma_1} (V_\theta)^M$.

**Proof.** Just note that

\[V_\delta \subset (V_\theta)^M \subset V_\theta.\]

Models $V_\delta, (V_\theta)^M$ agree about $\Sigma_0$ formulas. So each $\Sigma_1$ formula with parameters from $(V_\theta)^M$ true in $(V_\theta)^M$ is also true in $V_\theta$. But $V_\delta \prec_{\Sigma_1} V_\theta$, hence $V_\delta \prec_{\Sigma_1} (V_\theta)^M$.

\[\square\]

Let us make some changes in the definition of the preparation forcing $P' = P'(\theta)$.

**Definition 3.0.20** (Changes in the definition of $P'$).

1. $V_\tau$ is allowed to be an element of $A^{1_\tau}$, for $\tau \in s$ which is an inaccessible and $V_\tau \prec_{\Sigma_1} V_\theta$.

Note that $V_\tau$ will be the least (under $\in, \subseteq$) member of $A^{1_\tau}$, since $\tau$ is an element and contained in any other member of $A^{1_\tau}$.
2. If \( \tau \in s \) is a critical point of an elementary embedding \( j : V \rightarrow M, \tau M \subseteq M \) which is strong enough and the previous condition is satisfied, then it is allowed to have \( j''A \in A^{1\tau} \), for \( A \in A^{1\tau} \), provided the intersection properties are respected, i.e.:

- \( B \in \bigcup \rho \in s \setminus \tau A^{1\tau} \Rightarrow ipb(j''A, B) \),
- \( B \in A^{1\rho} \Rightarrow ip(j''A, B) \),
- \( B \in \bigcup \rho \in s \cap \tau A^{1\rho} \Rightarrow ip(B, j''A) \).

Note that allowing sets of the form \( j''A \) in \( A^{1\tau} \), we allow also as well a new Continuation in the definition of the set of models piste connected to a given model (see Chapter 2).

3. Let \( \tau \) be as in 1 above.

It is convenient to allow in the present context conditions having two top models for each \( \alpha \in s \cap \tau \). However conditions with a single top model in every cardinality will remain dense. Thus

\[
\langle \langle A^{00\xi}, A^{01\xi}, C^{\xi} \rangle \mid \xi \in s \cap \tau \rangle \cap \langle \langle A^{0\nu}, A^{1\nu}, C^{\nu} \rangle \mid \nu \in s \setminus \tau \rangle \in P'
\]

provided both

\[
\langle \langle A^{00\xi}, A^{1\xi}, C^{\xi} \rangle \mid \xi \in s \cap \tau \rangle \cap \langle \langle A^{0\nu}, A^{1\nu}, C^{\nu} \rangle \mid \nu \in s \setminus \tau \rangle,
\]

\[
\langle \langle A^{01\xi}, A^{1\xi}, C^{\xi} \rangle \mid \xi \in s \cap \tau \rangle \cap \langle \langle A^{0\nu}, A^{1\nu}, C^{\nu} \rangle \mid \nu \in s \setminus \tau \rangle
\]

are in \( P' \) and

- \( A^{00\xi} \in V_\tau \), for each \( \xi \in s \cap \tau \),
- the structures

\[
\langle A^{00\text{max}(s \cap \tau)}, <, \in, \subseteq, \kappa, \langle A^{00\xi}, A^{1\xi} \cap (A^{00\xi} \cup \{A^{00\xi}\}), C^{\xi} \mid (A^{00\xi} \cup \{A^{00\xi}\}) \mid \xi \in s \cap \tau \rangle \rangle
\]

and

\[
\langle A^{01\text{max}(s \cap \tau)}, <, \in, \subseteq, \kappa, \langle A^{01\xi}, A^{1\xi} \cap (A^{01\xi} \cup \{A^{01\xi}\}), C^{\xi} \mid (A^{01\xi} \cup \{A^{01\xi}\}) \mid \xi \in s \cap \tau \rangle \rangle
\]

are isomorphic over \( V_\tau \cap A^{01\text{max}(s \cap \tau)} \).

79
Let $p^0 = \langle \langle A^{0\xi}, A^{1\xi}, C^\xi \rangle \mid \xi \in s \cap \tau \rangle \rangle \langle \langle A^{0\nu}, A^{1\nu}, C^\nu \rangle \mid \nu \in s \setminus \tau \rangle \rangle$ and $p^1 = \langle \langle A^{0\xi}, A^{1\xi}, C^\xi \rangle \mid \xi \in s \cap \tau \rangle \rangle \langle \langle A^{0\nu}, A^{1\nu}, C^\nu \rangle \mid \nu \in s \setminus \tau \rangle \rangle$ be as in the previous item and $q \in P'(\tau)$ be an extension of $p^0$.

The next condition allows to combine $p^1$ and $q$ into a condition in $P'$ which is stronger than both $q, p^1$.

4. Let $\langle B_\xi \mid \xi \in s \rangle$ be an increasing continuous sequence such that for every $\xi \in s$ the following holds:
   
   (a) $B_\xi \prec V_\theta$,
   (b) $|B_\xi| = \xi$,
   (c) $q, p^1 \in B_\kappa^+$.

Then

$$r = \langle \langle A^{0\xi}(r), A^{1\xi}(r), C^\xi(r) \rangle \mid \xi \in s \rangle \in P'$$

and it is stronger than both $q, p^1$, where

- $A^{0\xi}(r) = B_\xi$,
- $A^{1\xi}(r) = A^{1\xi} \cup \{B_\xi\}$, if $\xi \in s \setminus \tau$ and $A^{1\xi}(r) = A^{1\xi} \cup \{B_\xi\} \cup A^{1\xi}(q)$, if $\xi \in s \cap \tau$
- $C^\xi(r) = C^\xi \cup \langle B_\xi, C^\xi \setminus B_\xi \rangle$, if $\xi \in s \setminus \tau$ and $C^\xi(r) = C^\xi \cup C^\xi(q) \cup \langle B_\xi, C^\xi(q) \setminus B_\xi \rangle$, if $\xi \in s \cap \tau$.

$\square$ of the changes.

The crucial observation will be that $P'$ breaks at each $\alpha \in S$ (or just for each $\alpha < \theta$ which is Mahlo and has $\delta$’s as in 3.0.19) into forcing $P'(\alpha)$ which deals with elementary submodels (or just closed enough subsets) of $V_\alpha$ and $P'_{\geq \alpha}$ which breaks in turn into $P'_{> \alpha} * P'_{\{\alpha\}} * Q_\alpha$.

Define $P'(\alpha)$ the same way as $P'$ but only with $V_\alpha$ replacing $V_\theta$. Thus in this notation $P'$ is actually $P'(\theta)$.

**Lemma 3.0.21** Suppose that $\alpha$ is a Mahlo cardinal. Then $P'(\alpha)$ satisfies $\alpha$ - c.c.

**Proof.** Let $\langle p_\beta \mid \beta < \alpha \rangle$ be a sequence of conditions in $P'(\alpha)$, $p_\beta = \langle \langle A^{0\tau}(p_\beta), A^{1\tau}(p_\beta), C^\tau(p_\beta) \rangle \rangle \tau \in s(p_\beta), \beta < \alpha$.

Consider their supports sequence $\langle s(p_\beta) \rangle \beta < \alpha$. Recall that supports are of the Easton form. Hence we can find a stationary $X \subseteq \alpha$ and $s$ such that $\langle s(p_\beta) \rangle \beta \in X$ forms a $\Delta$-system with support $s$. Moreover,
each \( \beta \in X \) is inaccessible

- \( s(p_\beta) \cap \beta = s \)

- if \( \gamma < \beta \) is also in \( X \) then for each \( \tau \in s(p_\gamma) \), then \( A^0r(p_\gamma) \subset V_\beta \).

This implies that

\[
A \subset V_\beta \subseteq B,
\]

whenever \( \gamma < \beta \) in \( X \), \( A \in A^1r, \tau \in s(p_\gamma) \) and \( B \in A^1p, \rho \in s(p_\beta) \). \backslash s \).

Shrinking \( X \) more, if necessary we can insure that for each \( \gamma, \beta \in X \) the following two structures

\[
\langle A^{\max(s)}(p_\beta), <, \subseteq, \kappa, A^{\max(s)}(p_\beta) \cap p_\beta \rangle
\]

and

\[
\langle A^{\max(s)}(p_\gamma), <, \subseteq, \kappa, A^{\max(s)}(p_\gamma) \cap p_\gamma \rangle
\]

are isomorphic over \( A^{\max(s)}(p_\beta) \cap A^{\max(s)}(p_\gamma) \). \backslash s \).

Note that \( A^0r(p_\beta) \)'s may have elements above \( \beta \).

Now we claim that such \( p_\beta \) and \( p_\gamma \) are compatible, say \( \gamma < \beta \). The proof repeats the corresponding argument in Chapter 2. Note that models of cardinalities in \( s_\gamma \backslash s \) should be added between models of \( p_\beta \) of cardinalities in \( s \) and those including them of cardinalities in \( s(p_\beta) \backslash s \). In order to this, we work over the center line of \( p_\beta \) add models which include \( p_\gamma \) as a member and then such setting via isomorphisms.

Lemma 3.0.22 Suppose that \( \alpha \) is a Mahlo cardinal and \( V_\alpha \prec V_\theta \). Then \( \mathcal{P}' \succ \mathcal{P}'(\alpha) \).

Proof. Consider \( \mathcal{P}' \cap V_\alpha \). By the definition of the preparation forcing Chapter 2 we have \( \mathcal{P}'(\alpha) = \mathcal{P}' \cap V_\alpha \). The cardinal \( \alpha \) is an inaccessible. Hence \( \alpha \supseteq V_\alpha \subseteq V_\alpha \). In particular, each antichain of \( \mathcal{P}'(\alpha) \) is in \( V_\alpha \), by the previous lemma. Hence, if \( H \subseteq \mathcal{P}'(\alpha) \) is \( \mathcal{P}'(\alpha) \)-generic over \( V_\alpha \), then \( H \) will be full \( \mathcal{P}'(\alpha) \)-generic.

Note that \( \mathcal{P}'(\alpha) \) is definable in \( V_\alpha \) and using the same formula that defines \( \mathcal{P}' \) in \( V_\theta \).

Let \( A \subseteq \mathcal{P}'(\alpha) \) be a maximal antichain. Then \( |A| < \alpha \) and, so \( A \in V_\alpha \). In addition,

\[ V_\alpha \upmodels A \text{ is a maximal antichain in } \mathcal{P}' . \]
Then, by elementarity, 
\[ V_\theta \models A \text{ is a maximal antichain in } \mathcal{P}'. \]

So, \( G \cap A \neq \emptyset \), for any generic \( G \subseteq \mathcal{P}' \). Also, \( V_\alpha [G \cap V_\alpha] \prec V_\theta [G] \).
\[ \square \]

By the lemma above \( \mathcal{P}' \) projects to \( \mathcal{P}'(\alpha) \). We prefer to deal with an explicit projection rather than with the projection defined via the corresponding Boolean algebras. In order to define an explicit projection we consider the following dense subset of \( \mathcal{P}' \):

\[
D = \{ \langle A^{0\tau}, A^{1\tau} \rangle, A^{1\tau}, C^\tau \mid \tau \in s \cap \alpha \} \cup \{ \langle A^{0\nu}, A^{1\nu} \rangle, C^\nu \mid \nu \in s \setminus \alpha \} \text{ in } \mathcal{P}' \mid \alpha \in s \land \forall \tau \in s \cap \alpha \ A^{0\tau} \in V_\alpha \text{ and the structure } \\
\langle A^{0\max(s \cap \alpha)}, \langle, \subseteq, \kappa, \langle A^{0\tau}, A^{1\tau} \cap \{ A^{0\tau} \} \cap (A^{0\tau} \cup \{ A^{0\tau} \}), C^\tau \mid (A^{0\tau} \cup \{ A^{0\tau} \}) \rangle \mid \tau \in s \cap \alpha \rangle \}
\]

is isomorphic to

\[
\langle A^{1\max(s \cap \alpha)}, \langle, \subseteq, \kappa, \langle A^{1\tau}, A^{1\tau} \cap \{ A^{1\tau} \} \cap (A^{1\tau} \cup \{ A^{1\tau} \}), C^\tau \mid (A^{1\tau} \cup \{ A^{1\tau} \}) \rangle \mid \tau \in s \cap \alpha \rangle
\]

over \( V_\alpha \cap A^{1\max(s \cap \alpha)} \).

Here is the point where we prefer to allow two top models \( (A^{0\tau}, A^{1\tau}, \tau \in s \cap \alpha) \) instead of a single one. Using \( V_\alpha \prec_{\Sigma_1} V_\theta \) it is easy to extend any standard (i.e. with single top model in each cardinality) condition in \( \mathcal{P}' \) to one in \( D \). We need just to intersect its part consisting of models of cardinality below \( \alpha \) with \( V_\alpha \) and then using elementarity of \( V_\alpha \) to find inside \( V_\alpha \) something isomorphic over this intersection.

Now, once we have \( p = \langle A^{0\tau}, A^{1\tau}, A^{1\tau} \rangle \mid \tau \in s \cap \alpha \} \cup \{ \langle A^{0\nu}, A^{1\nu}, C^\nu \mid \nu \in s \setminus \alpha \} \in D \), then define \( \sigma(p) \) to \( \mathcal{P}'(\alpha) \) to be

\[
\langle A^{0\tau}, A^{1\tau} \cap \mathcal{P}(A^{0\tau}), C^\tau \mid \mathcal{P}(A^{0\tau}) \rangle \mid \tau \in s \cap \alpha \} \cup \{ \langle A^{0\nu}, A^{1\nu}, C^\nu \mid \nu \in s \setminus \alpha \}.
\]

Let us check that such defined \( \sigma \) is indeed a projection map.

**Lemma 3.0.23** The map \( \sigma \) is a projection map from \( D \) to \( \mathcal{P}'(\alpha) \).

**Proof.** Let \( p \in D \) be as above and \( q \in \mathcal{P}'(\alpha) \) be an extension of \( \sigma(p) \). Pick increasing continuous sequence \( \langle B_\tau \mid \tau \in s \rangle \) such that for each \( \tau \in s \) the following holds:

1. \( B_\tau \prec V_\theta \)
2. \( |B_\tau| = \tau \)

82
3. \( p, q \in B_\kappa^+ \).

Now let \( r = \langle (A^{\check{\tau}}(r), A^{\check{\sigma}}(r), C^{\tau}(r)) | \tau \in s \rangle \) be defined as follows:

- \( A^{\check{\tau}}(r) = B_\tau \)
- \( A^{\check{\sigma}}(r) = A^{\check{\sigma}}(r) \cup \{B_\tau\} \) if \( \tau \in s \setminus \alpha \) and \( A^{\check{\sigma}}(r) = A^{\check{\sigma}}(r) \cup A^{\check{\tau}}(q) \) if \( \tau \in s \cap \alpha \)
- \( C^{\tau}(r) = C^{\tau} \cap (B_\tau, C^{\tau} \cap B^\check{\tau}) \) if \( \tau \in s \setminus \alpha \) and \( C^{\tau}(r) = C^{\tau} \cup C^{\tau}(q) \cup (B_\tau, C^{\tau}(q) \cap B^\check{\tau}) \) if \( \tau \in s \cap \alpha \).

Then \( r \) is an element of \( P' \) stronger than both \( p \) and \( q \). Note that the situation as here was specially allowed in 3.0.20 in contrast with the parallel definition of [9]. It remains to extend \( r \) to some \( r' \in D \) and then to take \( \sigma(r') \) which will be above \( q \).

\( \Box \)

**Lemma 3.0.24** Suppose that \( \alpha \) is a Mahlo cardinal and \( V_\alpha \prec V_\theta \). Let \( \gamma \prec \alpha \) be a regular cardinal. Then \( P'_{\geq \gamma} \supset P'(\alpha)_{\geq \gamma} \).

The proof repeats those of Lemma 3.0.22.

Note that \( P'_{\geq \alpha} \) does not add new sets of cardinalities \( \geq \alpha \) and \( P' = P'_{\geq \alpha} \ast P'_{< \alpha} \).

**Lemma 3.0.25** Let \( V_\alpha \prec V_\theta \), \( \alpha \) be a Mahlo and \( \delta \prec \alpha \) be a regular. Then \( P' = P'_{\geq \delta} \ast (P'(\alpha))_{< \delta} \).

**Proof.** Pick \( M \prec V_\alpha \), \( \delta^+ \subseteq M \) and \( |M| = \delta^+ \). By 3.0.22, we have \( P'_{= \delta} > (P'(\alpha))_{= \delta} \).

Note that \( M \cap P' = M \cap P'(\alpha) \), since \( M \prec V_\alpha \). Pick \( p \in V_\alpha \cap P'_{= \delta^+} \) to be \( (P'_{= \delta^+}, M) \)-generic. Then \( p \in (P'(\alpha))_{= \delta^+} \) and it is \( (P'(\alpha))_{= \delta^+} \)-generic. Pick now \( G_{\geq \delta^+} \subseteq P'_{= \delta^+} \) generic with \( p \in G_{\geq \delta^+} \) and \( G_{= \delta} \subseteq P_{= \delta} \) generic over \( V[G_{= \delta}] \). Recall that \( P_{= \delta} \) satisfies \( \delta^+ \)-c.c. Hence each antichain of \( P'_{= \delta} \) which belongs to \( M[p] \) will be contained in \( M[p] \). So, \( G_{= \delta} \cap M[p] \) will be \( (P'_{= \delta}, M[p]) \)-generic. But \( (G_{\geq \delta} \ast G_{= \delta}) \cap V_\alpha \) is \( P'_{\geq \delta} \)-generic over \( V_\alpha \), by 3.0.22. So \( G_{= \delta} \cap M[p] \) will be \( (P'_{= \delta}, M[p]) \)-generic. Denote \( G_{= \delta} \cap M[p] \) by \( G_M \). Then \( M[p, G_M] \prec V_\alpha[G_{\geq \delta} \ast G_{= \delta} \cap V_\alpha] \prec V_\theta[G_{= \delta}, G] \).

Let us turn now to \( P'_{< \delta} \). By 1.last, \( P'_{< \delta} \) in \( V_\theta[G_{= \delta}, G] \) is equivalent to \( P'_{< \delta} \cap M[p, G_M] \).

But \( M[p, G_M] \prec V_\alpha[G_{\geq \delta} \ast G_{= \delta} \cap V_\alpha] \). Hence, \( P'_{< \delta} \cap M[p, G_M] \) is just the same as \( (P'(\alpha))_{< \delta} \cap M[p, G_M] \). But this is last forcing is equivalent to \( (P'(\alpha))_{< \delta} \). So we are done.

\( \Box \)
Lemma 3.0.26 Let $V_\alpha < V_\theta$, $\alpha$ be a Mahlo and $\delta < \alpha$ be a regular. Then $\mathcal{P}' = \mathcal{P}'(\alpha)_{\geq \delta} \ast (Q \times (\mathcal{P}'(\alpha))_{< \delta})$.

Proof. By Lemma 3.0.24, $\mathcal{P}'_{\geq \delta} \supset \mathcal{P}'(\alpha)_{\geq \delta}$. So let $\mathcal{P}'_{\geq \delta} = \mathcal{P}'(\alpha)_{\geq \delta} \ast Q$, for some $Q$. Now, $\mathcal{P}'(\alpha) = \mathcal{P}'(\alpha)_{\geq \delta} \ast \mathcal{P}'(\alpha)_{< \delta}$. By Lemma 3.0.25 we have $\mathcal{P}' = \mathcal{P}'_{\geq \delta} \ast (\mathcal{P}'(\alpha))_{< \delta}$. Hence

$$\mathcal{P}' = \mathcal{P}'(\alpha)_{\geq \delta} \ast Q \ast (\mathcal{P}'(\alpha))_{< \delta}.$$ 

But $Q$ does not add new bounded subsets to $\alpha$. So this can be written as follows:

$$\mathcal{P}' = \mathcal{P}'(\alpha)_{\geq \delta} \ast (Q \times (\mathcal{P}'(\alpha))_{< \delta}).$$

□

Recall that $\mathcal{P}'_{\geq \alpha} \ast (\mathcal{P}'_{< \alpha})_{\geq \beta}$ is $\beta$-strategically closed, $\mathcal{P}'(\alpha)_{< \beta}$ satisfies $\beta^+$-c.c. and is actually isomorphic to a forcing of cardinality $\beta^+$, by ??.

Lemma 3.0.27 Let $\alpha \in S$, $\delta < \theta$, $(S \cap \delta) \setminus \alpha + 1 \neq \emptyset$ and

$$M \supseteq V_{j(\alpha)} = V_\theta$$

be a commutative diagram with $N$ being the ultrapower by an $(\alpha, \delta)$-extender. Then $i$ extends to

$$\hat{i} : V^{\mathcal{P}'} \longrightarrow N^{(\mathcal{P}')}.$$ 

Alternatively, using only strongs we can show that the following analog of this lemma holds:

Lemma 3.0.28 Suppose that

1. $\rho < \theta$ is a Mahlo cardinal
2. $V_\rho \prec \Sigma_1 V_\theta$
3. $\alpha$ is $\rho$-strong, as witnessed by $j : V \rightarrow M \supset V_\rho$

84
4. $\delta, \alpha < \delta < \rho$ is a regular cardinal

5. there is $\mu, \alpha < \mu < \delta$ such that $V_\mu \prec V_\rho$.

Let

$$M \supseteq V_\rho \xrightarrow{j} V \xrightarrow{k} N$$

be a commutative diagram with $N$ being the ultrapower by an $(\alpha, \delta)$-extender derived from $j$, such that $\rho = k(\xi)$, for some $\xi$. Then $i$ extends to

$$\hat{i} : V^{P'} \rightarrow N^{i(P')}.$$ 

The proofs of both lemmas are very similar. We concentrate on the proof of 3.0.27 and state the minor changes needed for those of 3.0.28

**Proof.** Note that by the definition of forcings $P'(\xi)$ we have $P' = P'(\theta)$. Also, $i(\theta) = \theta$, since $\theta$ is an inaccessible. In $N$, hence $i(P') = (P'(i(\theta)))^N = (P'(\theta))^N$. We split first $(P'(\theta))^N$ into $(P'(i(\alpha)) \times ((P'(\theta)_{\geq i(\alpha)}) \ast (P'(\theta)_{< i(\alpha)})_{\geq \alpha}))^N$.

Let us deal first with $(P'(i(\alpha)))^N$. Note that $V_\delta \subseteq N$. We split in $N$ the forcing $P'(i(\alpha))$ into $P'(i(\alpha))_{\geq \delta} \ast P'(i(\alpha))_{< \delta}$. The part $P'(i(\alpha))_{\geq \delta}$ is $\delta^+$-strategically closed. The extender used to form $N$ has no generators above $\delta$, so standard methods apply. Thus, we can find an $N$-generic set for $(P'(i_N(\alpha))_{\geq \delta})^N$ move it then to $N$ and in this way obtain an $N$-generic set for $(P'(i(\alpha))_{\geq \delta})^N$, where $N$ is the ultrapower by the measure $U = \{ X \subseteq \alpha^2 \mid (\alpha, \delta) \in i(X) \}$. For 3.0.28, we include also $\xi$, i.e. $U = \{ X \subseteq \alpha^3 \mid (\alpha, \delta, \xi) \in i(X) \}$. Denote the corresponding embedding by $i^*$ and those of $N$ into $N$ by $k^*$. Then we obtain the following commutative diagram:

$$
\begin{array}{ccc}
M & \supseteq V_{j(\alpha)} = V_\theta & \text{(or just } M \supseteq V_\rho \text{ in 3.0.28) } \\
\uparrow j & \uparrow k & \\
V & \xrightarrow{i} N & \\
\uparrow i & \uparrow k^* & \\
N^* & \simeq V^\alpha / U & 
\end{array}
$$

85
Let $\delta^*$ be the preimage of $\delta$ under $k^*$ (and $\xi^*$ the preimage of $\xi$). Use $\alpha^+$-strategic closure of $\mathcal{P}'(i^*(\alpha))_{\geq (\delta^*)^+}$ to build an $N^*$-generic subset of $(\mathcal{P}'(i^*(\alpha))_{\geq (\delta^*)^+})^{N^*}$. Then move it by $k^*$ to obtain an $N$-generic subset of $\mathcal{P}'(i^*(\alpha))_{\geq \delta}^N$.

We deal now with $(\mathcal{P}'(i(\alpha))_{< \delta})^N$. Let $A^* \in N^*$ be an elementary submodel of $(V_{\kappa(\alpha)})^{N^*}$ (or of $(V_{\xi*})^{N^*}$ in 3.0.28) of cardinality $(\delta^*)^{N^*}$ closed under $\delta^*$-sequences. Let $A \in N$ be $k^*(A^*)$. Then it is an elementary submodel of $(V_{\kappa(\alpha)})^N$ of cardinality $(\delta^+)^N$ closed under $\delta$-sequences. Let $k(A) = B$. Then, $B$ will be an elementary submodel of $(V_{\kappa(\alpha)})^M = V_{\kappa(\alpha)}$ (or of $(V_\rho)^M = V_\rho$ correspondently) of cardinality $\delta^+$. Recall that $k \upharpoonright (\delta^+)^N = id$, $|(\delta^+)^N| = \delta$, $cf((\delta^+)^N) = \alpha^+$ and $k((\delta^+)^N) = \delta^+$.

Pick in $N^*$ a condition $r_1 \in \mathcal{P}'(i^*(\alpha))_{\geq (\delta^*)^+}$ which is $A^*$-generic. Let $G^*$ be an $N^*$-generic subset of $(\mathcal{P}'(i^*(\alpha))_{\geq (\delta^*)^+})^{N^*}$ with $r_1 \in G^*$, built using the $\alpha^+$ strategic closure of the forcing.

Moving to $N$ we set $q_1 = k^*(r_1)$. Then $q_1 \in \mathcal{P}'(i(\alpha))_{\geq \delta^+}$ will be $A$-generic. Set $p_1 = k(q_1)$. Then, by elementarity, $p_1$ will be $B$-generic for the real $\mathcal{P}'(j(\alpha))_{\geq \delta^+}$.

Let $r_2$ be $G^* \cap A^*[r_1]$ and $q_2$ be generated by $k''r_2$. Then $q_2$ will be $(A, \mathcal{P}'(i(\alpha))_{\{\delta\}})$-generic set (remember that $\mathcal{P}'(i(\alpha))_{\{\delta\}}$ is $\delta^+$-strategically closed).

Consider $k''q_2$. It contains an increasing cofinal subset of size $\alpha^+$ - the image of $r_2$ under $k \circ k^*$. Now, $k''A \in B$, since $^\delta B \subseteq B$, by elementarity. Let $p_2 \in \mathcal{P}'(j(\alpha))_{\{\delta\}}$ be the union of conditions in $k''q_2$. It exists, due to this cofinal subset of size $\alpha^+$.

Chose a generic over $M$ (or the same $V$) with $(p_1, p_2)$ inside. Let $\tilde{p}_2$ be a $(B[p_1], \mathcal{P}'(j(\alpha))_{\{\delta\}})$-generic over $M$ with $p_2 \in \tilde{p}_2$. Then $k \upharpoonright A$ extends to an elementary embedding

$$\tilde{k} : A[q_1, q_2] \to B[p_1, \tilde{p}_2].$$

By 1.9, $\mathcal{P}'(j(\alpha))_{< \delta}$ is equivalent to $\mathcal{P}'(j(\alpha))_{< \delta} \cap B[p_1, \tilde{p}_2]$ and the same is true in $N$ replacing $B[p_1, \tilde{p}_2]$ by $A[q_1, q_2]$. Also, by 1.?, $\mathcal{P}'(j(\alpha))_{< \delta}$ satisfies $\delta^+$-c.c. Hence $\tilde{k}$ will move maximal antichains to maximal antichains. This allows us to obtain $(\mathcal{P}'(i(\alpha)))^{N^*}_{< \delta}$-generic set from $\mathcal{P}'(j(\alpha))_{< \delta}$-generic one, just intersect the last one with $\tilde{k}''A[q_1, \tilde{q}_2]$ and pull back the result to $N$ using $\tilde{k}^{-1}$.

Putting together now the parts above and below $\delta$ we will obtain an $N$ generic subset $G_{\kappa(\alpha)}$ of $(\mathcal{P}'(i(\alpha)))^N$.

Let us turn now to the forcing $(\mathcal{P}'(\theta))^N$ and also deal with the master condition part.

Let $\mu \in (S \cap \delta) \setminus (\alpha + 1)$ (or in 3.0.28, let $\mu$ be as in (5), i.e. $V_\mu < V_\rho$). We pick in $V$ an elementary submodel $A \prec V_\mu \prec V_\theta$ (or $V_\rho$) of cardinality $\alpha^+$ and closed under $\alpha$-sequences of its elements. Let $p$ be $\mathcal{P}'_{\geq \alpha^+}$-generic over $A$. It exists since $\mathcal{P}'_{\geq \alpha^+}$ is $\alpha^+$-strategically closed. Fix an increasing continuous sequence $\langle A_\nu \mid \nu < \alpha^+ \rangle$ of elementary submodels of $A$ each of
cardinality $\alpha$, $(A_\xi \mid \xi \leq \nu) \in A_{\nu+1}$ and $V_\alpha \in A_0$. Without loss of generality for each $\nu < \alpha^+$ we may assume that $A_\nu[p \cap A_\nu] < A[p]$. Consider now the forcing $\mathcal{P}'_{=\alpha}$. It satisfies $\alpha^{++}$ -c.c. Hence each antichain in $\mathcal{P}'_{=\alpha}$ that belongs to $A[p]$ is contained in $A[p]$. Now working inside $A$ it is easy to see for each $\xi < \alpha^+$ the set of conditions $q$ in $\mathcal{P}'_{=\alpha}$ having $A_\nu$ for some $\nu$, $\xi < \nu < \alpha^+$, as the maximal model, i.e. $A^{\alpha_\nu}(q) = A_\nu$ is dense. Let us use $G_{i(\alpha)} \cap \mathcal{P}'_{=\alpha}(\delta^*)$ to produce $\mathcal{P}'_{=\alpha}$ -generic over $A$. Note that the set

$$T = \{ \nu < \alpha^+ \mid A_\nu \text{ is the maximal model of a condition in this generic set} \}$$

is unbounded. Actually, using $\alpha^+$ -strategic closure of $\mathcal{P}'_{=\alpha}$ it is not hard to see that $T$ is stationery and fat.

Consider in $N$ models

$$B = i(A), B_{i(\nu)} = i(A_\nu), B[i(p)], B_{i(\nu)}[i(p) \cap B_{i(\nu)}].$$

We have $\cup(i''\alpha^+) = i(\alpha^+)$, hence

$$B = \bigcup_{\nu < \alpha^+} B_{i(\nu)} \text{ and } B[i(p)] = \bigcup_{\nu < \alpha^+} B_{i(\nu)}[i(p) \cap B_{i(\nu)}].$$

Now we fix a list $\langle E_\nu \mid \nu < \alpha^+ \rangle$ of dense open subsets of $((\mathcal{P}'(\theta)_{<i(\alpha)})_{\geq \delta})^N$ in $B[i(p)]$ which are the images of all dense open subsets coming from the ultrapower by the normal measure of the extender $i$. Note that the forcing under the consideration is $\delta^+$-strategically closed (in $N$) and the generators of $i$ are below $\delta$, so this can be done.

For each $\nu < \alpha^+$ let $E'_\nu$ be the dense open subset of $((\mathcal{P}'(\theta)_{<i(\alpha)})_{\geq \alpha})^N$ obtained from $E_\nu$ by adding to each $q \in E_\nu$ models of cardinalities in the interval $[\alpha, \delta]$, i.e. $q^\frown r \in E'_\nu$ iff $q \in E_\nu$, $q^\frown r \in ((\mathcal{P}'(\theta)_{<i(\alpha)})_{\geq \alpha})^N$ and $r$ consists of models of cardinalities in the interval $[\alpha, \delta]$. We may assume that $E'_\nu$ (and hence also $E'_\nu$) is in $B_{i(\nu)}[i(p) \cap B_{i(\nu)}]$, just removing some of $B_\nu$’s if necessary.

Recall that $G_{i(\alpha)}$ is an $N$ -generic subset of $((\mathcal{P}'(i(\alpha)))^N$ constructed above. Our next tusk will be to consider the projection of $((\mathcal{P}'(\theta)))_{\geq \alpha}^N$ over $G_{i(\alpha)}$ and to claim that certain elements are in $((\mathcal{P}'(\theta)))_{\geq \alpha}/G_{i(\alpha)}$.

**Claim 3.0.27.1** For each $\nu \in T$ of cofinality $\alpha$ we have $i''A_\nu \in ((\mathcal{P}'(\theta)))_{\geq \alpha}/G_{i(\alpha)}$.

**Remark** Note that $(G_{i(\alpha)})_{\geq \alpha} \cap A_\nu$ is a condition in $\mathcal{P}'$ (or just in $((\mathcal{P}'(i(\alpha)))^N$), due to defl.1(28)). Our interest is in $((G_{i(\alpha)})_{\geq \alpha} \cap A_\nu) \frown A_\nu$. By putting in $i''A_\nu$ we actually add all of $i''((G_{i(\alpha)})_{\geq \alpha} \cap A_\nu) \frown A_\nu)$. The claim basically deals with it rather then only with $i''A_\nu$.
Proof. Consider $C^\alpha(A_\nu) \upharpoonright A_\nu$. It is a closed unbounded sequence in $A_\nu$ and since $cof(\nu) = \alpha$, it has a cofinal subsequence $(A_{\nu,\beta}| \beta < \alpha)$. Apply $i$. Then $i((A_{\nu,\beta}| \beta < \alpha))$ will be a cofinal subsequence of $C^{\alpha}(A_\nu) = i(C^\alpha(A_\nu))$. Denote $i((A_{\nu,\beta}| \beta < \alpha))$ by $(B_{\nu,\beta}| \beta < i(\alpha))$. Clearly, $i''A_\nu \subset B_{\nu,\alpha}$.

It is enough to show that $i''A_\nu$ is compatible with every element of $G_{i(\alpha)}$. Note that models of cardinalities $\geq \alpha$ are mapped to generic set over $N$ for $(P'(\theta))_{\geq i(\alpha)}$, just this set is generated by such images. Hence there is no problems with the images (i.e. $i(X)$) of elements of $A_\nu \cap (G_{i(\alpha)})_{\geq \alpha}$. We need only to take care of $i''X$ for $X \in (A_\nu \cap (G_{i(\alpha)})_{= \alpha}) \cup \{ A_\nu \}$.

Pick any element $q$ of $(P'(i(\alpha)))^N$ with $A_\nu$ inside. Assume also that $A_\nu$ is on the central line of $q$. Consider $i(q)$. It will consists of models of cardinalities below $\alpha$ and those of cardinalities at least $i(\alpha)$ (remember that each condition has Easton support). Also $B_\nu$ appears in $i(q)$ on the central line. We would like to find a common extension of $q$ and $i(q)$ which includes $i''A_\nu$. Proceed as follows. Pick first some $\beta^*, \alpha < \beta^* < i(\alpha)$, such that $B_{\beta^*}$ is a unique immediate predecessor of $B_{\beta^*+1}$ and there is no models of cardinalities above $i(\alpha)$ (and so, no models at all) in between. Using elementarity and density argument it is possible to find such $\beta^*$. Now inside $B_{\nu,\beta^*}$ we pick an increasing continuous sequence $\langle X_\tau| \tau \in s(q) \rangle$ of models (elementary or $\Sigma_1$-elementary in $B_{\nu,\beta^*}$) such that $q, i''A_\nu, i(q) \cap B_{\nu,\beta^*+1} \in X_{\kappa^+}$. Then $q^\frown i''A_\nu \frown (X_\tau| \tau \in s(q)) \frown i(q)$ will be as desired.

$\Box$ of the claim.

Let $\nu_0$ be the first element of $T$ of cofinality $\alpha$. Consider $A_{\nu_0} \frown i''A_{\nu_0}$. By Claim 3.0.27.1, $A_{\nu_0} \frown i''A_{\nu_0} \in (P'(\theta))^N / G_{i(\alpha)}$. Now inside $B_{\nu_0}$ we extend $A_{\nu_0} \frown i''A_{\nu_0}$ to a condition $q_0$ in $E_0'$ with the projection to $(P'(i(\alpha)))_{\geq \alpha}^N$ inside $G_{i(\alpha)}$.

**Claim 3.0.27.2** $q_0 \frown B_{\nu_0} \in (P'(\theta))^N / G_{i(\alpha)}$.

Proof. Again we need to show that $q_0 \frown B_{\nu_0}$ is compatible with every element of $G_{i(\alpha)}$. Let $t \in G_{i(\alpha)}$ There is a common extension $q$ of $q_0$ and $t$ with projection in $G_{i(\alpha)}$, since $q_0 \in (P'(\theta))^N / G_{i(\alpha)}$. By elementarity, we can find such $q$ inside $B_{\nu_0}$. Thus

$$(P'(i(\alpha)))^N \subseteq (V_{i(\alpha)})^N \subseteq B_{\nu_0}$$

and, hence

$$B_{\nu_0}[G_{i(\alpha)}] \prec B[G_{i(\alpha)}] \prec (V_0[G_{i(\alpha)}])^N.$$  

Also, $B_{\nu_0}[G_{i(\alpha)}] \cap (P'(\theta))^N = B_{\nu_0} \cap (P'(\theta))^N$.

Consider $q \frown B_{\nu_0}$. It is almost a condition in $(P'(\theta))^N$ only with maximal models missing for lot of cardinalities. Extend it to some $r \in (P'(\theta))^N$ for which the projection to $(P'(\theta))^N$
is defined. Then \( r \geq q \) implies that the projection \( r' \) of \( r \) is above the one of \( q \). But then \( r' \geq t \) in \((\mathcal{P}'(i(\alpha)))^N\). This means in particular that \( q_{0} \sim B_{v_{0}} \) is compatible with \( t \).

\( \Box \) of the claim.

We proceed similar at each successor stage. Thus, if for \( \xi < \alpha^{+} \), \( q_{\xi}, B_{v_{\xi}} \) are defined \( q_{\xi} \subseteq B_{v_{\xi}} \) and \( q_{\xi} \sim B_{v_{\xi}} \in (\mathcal{P}'(\theta))^{N}/G_{i(\alpha)} \), then we pick \( \nu_{\xi+1} \) to be the least element of \( T \) above \( \nu_{\xi} \) such that \( \text{cof}(\nu_{\xi+1}) = \alpha \) and \( A_{v_{\xi}} \in \mathcal{C}^{\alpha}(A_{v_{\xi+1}}) \). As in Claim 3.0.27.1, we will have \( q = A_{v_{\xi+1}} \sim B_{v_{\xi}} \in (\mathcal{P}'(\theta))^{N}/G_{i(\alpha)} \).

Now inside \( B_{v_{\xi+1}} \) we extend \( q \) to a condition \( q_{\xi+1} \) in \( E_{\xi+1}' \) with the projection to \((\mathcal{P}'(i(\alpha)))^N_{\geq \alpha} \) inside \( G_{i(\alpha)} \). Then, as in Claim 3.0.27.2, we will have \( q_{\xi+1} \sim B_{v_{\xi+1}} \in (\mathcal{P}'(\theta))^{N}/G_{i(\alpha)} \).

Let us turn to limit stages of the construction. Assume that \( \xi \) is a limit ordinal. Let \( \nu_{\xi} = \bigcup_{\tau < \xi} \nu_{\tau}, \nu_{\xi+1} \) be the first element of \( T \backslash \nu_{\xi} + 1 \) of cofinality \( \alpha \) and \( q'_{\xi} = \bigcup \{ q_{\tau} | \tau < \xi \} \). This \( q'_{\xi} \) is just the formal union of all \( q_{\tau} \)'s constructed at the previous stages. We do not take unions of the maximal models of \( q_{\tau} \)'s etc. Let \( q''_{\xi} \) be obtained from \( q'_{\xi} \) by adding \( i''A_{v_{\xi+1}} \) and, if \( A_{v_{\xi}} \) is in a condition in \( G_{i(\alpha)} \), then also \( i''A_{v_{\xi}} \).

**Claim 3.0.27** \( q''_{\xi} \) projects to an element of \( G_{i(\alpha)} \).

**Proof.** Let us show that for each \( t_{1} \in G_{i(\alpha)} \) above the projection of \( q'_{\xi} \) the following holds:

- if \( t \in (\mathcal{P}'(i(\alpha)))^{N}_{\geq \alpha} \) and \( t \geq t_{1} \), then there is \( q \geq q''_{\xi} \) with the projection to \((\mathcal{P}'(i(\alpha)))^N_{\geq \alpha} \) stronger than \( t \).

Let \( t_{1} \leq t \) be as above. Then initial segments of \( q''_{\xi} \) project below \( t \). Just \( q'_{\xi} \) projects to a condition in \( G_{i(\alpha)} \) below \( t_{1} \leq t \). Also, the addition of \( i''A_{v_{\xi+1}}, i''A_{v_{\xi}} \) is above \( i(\alpha) \). So we can find a common extension \( r \in B_{i(v_{\xi+1})} \) of \( t \) and \( q''_{\xi} \). Using the elementarity of \( V_{i(\alpha)}^{N} \), find \( r' \in (V_{i(\alpha)} \cap (\mathcal{P}'(i(\alpha)))^{N}_{\geq \alpha})^{N} \) realizing the same type as \( r \) over \( r \cap V_{i(\alpha)}^{N} \). Finally, let \( q \) be obtained from \( r \cup r' \) by adding the maximal models including those of both \( r, r' \) and this models via \( C^{\rho}(q) \)'s to those of \( r' \). Then the projection of \( q \) to \((\mathcal{P}'(i(\alpha)))^{N}_{\geq \alpha} \) is \( r' \geq t \) and we are done.

\( \Box \) of the claim.

Now we extend \( q''_{\xi} \) to \( q_{\xi} \in E_{\xi} \) in \( B_{i(v_{\xi+1})} \) with the projection to \((\mathcal{P}'(i(\alpha)))^N_{\geq \alpha} \) inside \( G_{i(\alpha)} \).

This completes the construction.

Consider finally the resulting sequence \( \langle q_{\nu} | \nu < \alpha^{+} \rangle \). Let \( \langle q_{\nu}^{*} | \nu < \alpha^{+} \rangle \) be the sequence obtained from it by removing from each \( q_{\nu} \) models of cardinalities below \( \delta^{+} \). Then, \( q_{\nu}^{*} \in E_{\nu} \) for every \( \nu < \alpha^{+} \). Hence \( \langle q_{\nu}^{*} | \nu < \alpha^{+} \rangle \) generates a \( B[i(p)] \)-generic subset of \((\mathcal{P}'(\theta))_{<i(\alpha)}^{\delta^{+}})^{N} \). By the construction, the projections of \( q_{\nu}^{*} \)'s to \((\mathcal{P}'(i(\alpha)))_{\geq \alpha}^{N} \) are in \( G_{i(\alpha)} \cap (\mathcal{P}'(i(\alpha)))_{\geq \alpha}^{N} \). The same is true (again by the construction) for \( q_{\nu} \)'s, i.e. projections to \((\mathcal{P}'(i(\alpha)))_{\geq \alpha}^{N} \) are in \( G_{i(\alpha)} \cap (\mathcal{P}'(i(\alpha)))_{\geq \alpha}^{N} \). Then \( q_{\nu} \)'s will be in \( B[i(p)] \)-generic subset of \((\mathcal{P}'(\theta))_{<i(\alpha)}^{\delta^{+}})^{N} \)
generated by $G_{i(\alpha)} \cap (P'(i(\alpha))_{\geq \alpha})^N$ and $\langle q^*_\nu \mid \nu < \alpha^+ \rangle$. Moreover, models $i''(A_\nu)$ appear in $q_\nu$’s. Each $r \in P'_{<\alpha}$ which is inside some $A_\nu$ will be moved by $i$ to $i(r) \in (P'(\theta)_{<\alpha})^N$ inside $i''A_\nu$. But $i''A_\nu$ is a model inside a condition in generic set, so $i(r)$ is such as well. Hence images of elements from $G_{i(\alpha)} \cap P'_{<\alpha}$ are in the constructed this way $N$-generic subset of $(P'(\theta)_{<\alpha})^N$. So we are done.

$\Box$ of the lemma.
Chapter 4

Dropping cofinalities-gap 3-single drop

Our aim is to present constructions in which $2^\kappa = \kappa^3$ and the cofinality $\kappa^{++}$ drops down, i.e. the generator $b_{\kappa^{++}}$ for the cofinality $\kappa^{++}$ is far apart from $b_{\kappa^3}$.

4.1 Preliminary Settings

Let $\lambda_0 < \kappa_0 < \lambda_1 < \kappa_1 < ... < \lambda_n < \kappa_n < ..., n < \omega$ be a sequence of cardinals such that for each $n < \omega$

- $\lambda_n$ is $\lambda_n^{++}$ - strong as witnessed by an extender $E_{\lambda_n}$
- $\kappa_n$ is $\kappa_n^{++}$ - strong as witnessed by an extender $E_{\kappa_n}$

Let $\kappa = \bigcup_{n<\omega} \kappa_n$.

Force with the forcing $\mathcal{P}'$ of Chapter 1. Let $G(\mathcal{P}')$ be a generic subset.

4.2 Models and types

The main difference in present setting from those of [1], Chapter 1 will be due to the fact that the cardinalities of models in the range of a condition (i.e. in suitable structures over $\kappa_n$’s) may be smaller than the number of existing types. So any such model may contain only a limited number of types. We would like to insure that it will be still sufficiently large.

Fix $n < \omega$. Set $\delta_n = \kappa_n^{++}$. Denote by $\delta_n^-$ the immediate predecessor of $\delta_n$, i.e. $\kappa_n^{++}$. Fix using GCH an enumeration $\langle a_\alpha \mid \alpha < \kappa_n \rangle$ of $[\kappa_n]<\kappa_n$ so that for every successor cardinal $\delta < \kappa_n$ the initial segment $\langle a_\alpha \mid \alpha < \delta \rangle$ enumerates $[\delta]<\delta$ and every element of $[\delta]<\delta$ appears
stationary many times in each cofinality < δ in the enumeration. Let \( j_n(\langle a_\alpha \mid \alpha < \kappa_n \rangle) = \langle a_\alpha \mid \alpha < j_n(\kappa_n) \rangle \) where \( j_n \) is the canonical embedding of the \((\kappa_n, \delta_n^+)\)-extender \( E_n \). Then \( \langle a_\alpha \mid \alpha < \delta_n^+ \rangle \) will enumerate \([\delta_n^+]^{\leq \delta_n}\) and we fix this enumeration. For each \( k \leq \omega \) consider a structure

\[
\mathfrak{A}_{n,k} = \langle H(\chi^{+k}), \in, \subseteq, \leq, E_{\kappa_n}, E_{\lambda_n}, \lambda_n, \kappa_n, \delta_n, \delta_n^+, \chi, \langle a_\alpha \mid \alpha < \delta_n^{+k} \rangle, 0, 1, \ldots, \alpha, \ldots \mid \alpha < \kappa_n^{+k} \rangle
\]

in the appropriate language \( \mathcal{L}_{n,k} \) with a large enough regular cardinal \( \chi \).

**Remark 4.2.1** It is possible to use \( \kappa_n^{++} \) here (as well as in [1]) instead of \( \kappa_n^{+k} \). The point is that there are only \( \kappa_n^{++} \) many ultrafilters over \( \kappa_n \) and we would like that equivalent conditions use the same ultrafilter. The only parameter that that need to vary is \( k \) in \( H(\chi^{+k}) \).

Let \( \mathcal{L}'_{n,k} \) be the expansion of \( \mathcal{L}_{n,k} \) by adding a new constant \( c' \). For \( a \in H(\chi^{+k}) \) of cardinality less or equal than \( \delta_n \) let \( \mathfrak{A}_{n,k,a} \) be the expansion of \( \mathfrak{A}_{n,k} \) obtained by interpreting \( c' \) as \( a \).

Let \( a, b \in H(\chi^{+k}) \) be two sets of cardinality less or equal than \( \delta_n \). Denote by \( tp_{n,k}(b) \) the \( \mathcal{L}_{n,k} \)-type realized by \( b \) in \( \mathfrak{A}_{n,k} \). Further we identify it with the ordinal coding it and refer to it as the \( k \)-type of \( b \). Let \( tp_{n,k}(a,b) \) be a the \( \mathcal{L}'_{n,k} \)-type realized by \( b \) in \( \mathfrak{A}_{n,k,a} \). Note that coding \( a, b \) by ordinals we can transform this to the ordinal types of [1].
4.3 The main forcing

We will use $\lambda_n$'s ($n < \omega$) to generate $\omega$-sequences corresponding to ordinals below $\kappa^{++}$ in the same way as it was done in [1].

The treatment of $\kappa^{+3}$ will be parallel to those of Chapter 1, but with major changes due to the lack of cardinals between $\kappa_n$ and $\kappa_n^{+n+2}$ that correspond to $\kappa^{++}$. Here $\kappa_n^{+n+2}$ will correspond to $\kappa^{+3}$ and $\lambda_n^{+n+2}$ to $\kappa^{++}$. Recall that in Chapter 1, $\kappa_n^{+n+3}$ corresponds to $\kappa^{+3}$ and $\kappa_n^{+n+2}$ to $\kappa^{++}$.

We will use suitable and suitable generic structures over $\kappa$ as defined in Chapter 1. The corresponding structures over $\kappa_n$'s will be rather names related to choices made over $\lambda_n$'s.

Fix $n < \omega$.

Let give first the following preliminary definition:

**Definition 4.3.1** Let $\eta$ be a cardinal less than $\lambda_n$. A suitable structure $\langle \langle X, Y \rangle, C, \in, \subseteq \rangle$ at the level $\kappa_n$ (see Chapter 1) is called an $\eta$-suitable iff each element of $X$ (i.e. each model) has cardinality $\eta$.

Note that in Chapter 1 models at the level $\kappa_n$ have cardinality $\kappa_n^{+n+2}$. Here it drops below $\lambda_n < \kappa_n$.

**Definition 4.3.2** Let $Q_{n0}$ be the set consisting of pairs of triples

$$q = \langle \langle a, A, f \rangle, \langle b, B, g \rangle \rangle$$

so that:

1. $f$ is partial function from $\kappa^{+2}$ to $\lambda_n$ of cardinality at most $\kappa$

2. There is a suitable generic structure $\langle \langle X, Y \rangle, C, \in, \subseteq \rangle$ of cardinality less than $\lambda_n$ (not $\kappa_n$, as in Chapter 1), such that

   a is an order preserving function from the set $\{ Z \cap \kappa^{++} \mid Z \in X \}$ to $\lambda_n^{+n+2}$.

   Note that by Chapter 1, the set $\{ Z \cap \kappa^{++} \mid Z \in X \}$ is a closed subset of $\kappa^{++}$.

3. $a(\max(X) \cap \kappa^{++}) = \max(\operatorname{rng}(a))$ is above all the elements of $\operatorname{rng}(a)$ in the order of the extender $E_{\lambda_n}$.

4. $\operatorname{dom}(a) \cap \operatorname{dom}(f) = \emptyset$. 

93
5. \( A \in E_{\lambda, \max(\text{rng}(a))}. \)

6. \( \min(A) > |X|. \)

7. For every ordinals \( \alpha, \beta, \gamma \in \text{rng}(a) \) and \( \rho \in \pi''_{\lambda_n, \max \text{rng}(a), a}(A) \)
   \[
   \alpha \geq E_{\lambda_n} \beta \geq E_{\lambda_n} \gamma \quad \text{implies} \quad \pi_{\lambda_n, \alpha, \gamma}(\rho) = \pi_{\lambda_n, \beta, \gamma}(\pi_{\lambda_n, \alpha, \beta}(\rho)).
   \]

8. For every \( \alpha > \beta \in \text{rng}(a) \) and \( \rho \in A \)
   \[
   \pi_{\lambda_n, \max \text{rng}(a), \alpha}(\rho) > \pi_{\lambda_n, \max \text{rng}(a), \beta}(\rho). \]
   Let us turn now to the second component of a condition, i.e., to \( \langle b, B, g \rangle \).

9. \( g \) is a function from \( \kappa^{+3} \) to \( \kappa_n \) of cardinality at most \( \kappa \).

10. \( \tilde{b} \) is a name, depending on \( \langle a, A \rangle \). For each \( \eta \in A \) the interpretation \( \tilde{b}[\eta] \) of \( \tilde{b} \) according to \( \eta \) satisfies the following conditions.
    
    (a) There is an \((\eta^0)^{+n+1}\)-suitable structure \( \langle \langle X_\eta, Y_\eta \rangle, C_\eta, \epsilon, \subseteq \rangle \) at the level \( \kappa_n \) such that
        
    i. \( \tilde{b}[\eta] \) is the isomorphism between \( \langle \langle X, Y \rangle, C, \epsilon, \subseteq \rangle \) and \( \langle \langle X_\eta, Y_\eta \rangle, C_\eta, \epsilon, \subseteq \rangle \),
        
    ii. for every \( Z \in X \) we have
        \[
        \pi_{\lambda_n, \max \text{rng}(a), a}(Z \cap \kappa^{++})(\eta) = \tilde{b}[\eta](Z) \cap ((\eta^0)^{+n+2}).
        \]
        
    In particular,
    \[
    \eta = \tilde{b}[\eta](\max(X)) \cap ((\eta^0)^{+n+2}).
    \]
    Further let us identify between \( \tilde{b}[\eta](Z) \) and \( \tilde{b}(Z)[\eta] \).
    Note that the domain of \( \tilde{b} \) is \( X \) and this does not depend on \( \eta \).

    (b) (Dependence) Let \( Z \in X \). Then \( \tilde{b}[\eta](Z) \) depends on the value of the one element Prikry forcing with the measure \( a(Z \cap \kappa^{++}) \) over \( \lambda_n \). More precisely: let
    \[
    A(Z) = \pi_{\lambda_n, \max \text{rng}(a), a}(Z \cap \kappa^{++})''A,
    \]
    then each choice of an element from \( A(Z) \) already decides \( \tilde{b}(Z) \), i.e., whenever \( \eta_1, \eta_2 \in A \) and
    \[
    \pi_{\lambda_n, \max \text{rng}(a), a}(Z \cap \kappa^{++})(\eta_1) = \pi_{\lambda_n, \max \text{rng}(a), a}(Z \cap \kappa^{++})(\eta_2)
    \]

94
we have

\[ b(Z)[\eta_1] = b(Z)[\eta_2]. \]

Further let us denote by \( \eta(Z) \) the projection of \( \eta \) to \( a(Z \cap \kappa^+) \), i.e. \( \pi_{\lambda_n, \max \text{rng}(a), a(Z \cap \kappa^+)}(\eta) \), for each \( \eta \in A \).

So \( b(Z) \) depends only on members of \( A(Z) \) rather than those of \( A \).

The next condition is crucial for the \( \kappa^+ \)-c.c. of the forcing.

(c) (Inclusion condition)

Let \( \eta, \eta' \in A, \eta < \eta' \). Then

- \( b(\max(X))[\eta] \in b(\max(X))[\eta'] \),
- if \( Z \in X \cap C(\max(X)) \) and

\[ \pi_{\lambda_n, \max \text{rng}(a), a(Z \cap \kappa^+)}(\eta') > \eta, \]

then either

\[ b(\max(X))[\eta] \in b(Z)[\eta'] \]

or the \( k \)-type realized by \( b(\max(X))[\eta] \cap H(\chi^k) \) is in \( b(Z)[\eta'] \), where \( k < \omega \) is the least such that \( b(Z)[\eta'] \subseteq H(\chi^{k+1}) \).

The same holds over any element of \( b(Z)[\eta'] \), i.e. \( tp_k(z, b(\max(X))[\eta] \cap H(\chi^k)) \in b(Z)[\eta'] \), for any \( z \in b(Z)[\eta'] \).

We require in addition that this \( k > 2 \).

Let us allow the above also if \( b(Z)[\eta'] \subseteq H(\chi^\omega) \). In this case we take \( k \) to be any natural number above 2 and require that once we go up to the higher levels then corresponding \( k \)'s increase (with \( n \)).

We cannot in general require only that

\[ b(\max(X))[\eta] \in b(Z)[\eta'] \]

since the sequence \( C \) of a new generic suitable structure may go not through the old maximal model. But still having the type inside \( Z \) will suffice.

Note that given \( \eta' \in A \) the number of possibilities for \( \eta \in \eta' \cap A \) is bounded by \((\eta^0)^{n+1}, \) as \( \eta' < (\eta^0)^{n+2}. \)

(d) \( Y \cap \text{dom}(g) = \emptyset. \)
(e) For every $\alpha \in Y$ and $\eta \in A$

i. $b[\eta](\alpha)$ is a model of cardinality $\kappa_n^{+n+1}$,

ii. $\kappa_n^{+n+1} \subseteq b[\eta](\alpha)$,

iii. $\text{cof}(\text{sup}(b[\eta](\alpha) \cap \kappa_n^{+n+2})) = (\eta^0)^{+n+2}$.

Note that all the cardinals $\kappa_n, \ldots, \kappa_n^{+n+1}$ will correspond here to $\kappa^+$. So, we need to drop down to to the indiscernible $(\eta^0)^{+n+2}$ for $\lambda_n^{+n+2}$ in order to get to $\kappa^+$.

(f) For every $\eta \in A$

$$B[\eta] \in E_{\kappa_n, \max(X_n)}.$$ 

(g) For every $\eta \in A$ and ordinals $\alpha, \beta, \gamma$ which are elements of $\text{rng}(b[\eta])$ (i.e. actually the ordinals coding models in $\text{rng}(b[\eta])$) we have

$$\alpha \geq \xi_{\kappa_n, \kappa_n^{+}} \beta \geq \xi_{\kappa_n, \kappa_n^{+}} \gamma \quad \text{implies}$$

$$\pi_{\kappa_n, \alpha, \gamma}(\rho) = \pi_{\kappa_n, \alpha, \gamma}(\pi_{\kappa_n, \alpha, \beta}(\rho))$$

for every $\rho \in \pi_{\kappa_n, \max \text{rng}(b[\eta])}, \alpha(B[\eta])$.

(h) for every $Z \in \text{dom}(b_n)$ there is $k(Z) \leq \omega$ such that for every $\eta \in A$ we have

$$b_n(Z)[\eta] \prec H(\chi^{+k(Z)}).$$

Note that it is easy to arrange this condition just by shrinking $A$. Thus for each $\eta \in A$ there is $k_\eta \leq \omega$ such that $b_n(Z)[\eta] \prec H(\chi^{+k_\eta})$. Now pick $A_Z \subseteq A$ in $E_{\lambda_n, \max(\text{rng}(a))}$ and $k(Z) \leq \omega$ such that for every $\eta \in A_Z$, $k_\eta = k(Z)$. Finally replace $A$ by $\bigcap \{A_Z | Z \in \text{dom}(b_n)\}$. Note this intersection is still in $E_{\lambda_n, \max(\text{rng}(a))}$, since $|\text{dom}(b_n)| < \lambda_n$.

**Definition 4.3.3** Suppose that $\langle\langle a, A, g \rangle, \langle b, B, g \rangle \rangle$ and $\langle\langle a', A', f' \rangle, \langle b', B', g' \rangle \rangle$ are two elements of $Q_{n_0}$. Define

$$\langle\langle a, A, g \rangle, \langle b, B, g \rangle \rangle \geq Q_{n_0} \langle\langle a', A', f' \rangle, \langle b', B', g' \rangle \rangle$$

iff

1. $f \supseteq f'$
2. $g \supseteq g'$
3. $a \supseteq a'$

96
4. $\mathcal{P}_{\lambda_n, \max(a), \max(a')} A \subseteq A'$

5. for every $\nu \in A$ we have
   \[ b[\nu] \supseteq b'[\mathcal{P}_{\lambda_n, \max(a), \max(a')}(\nu)]. \]
   This means just that the empty condition of one element Prikry forcing forces the inclusion.

6. for every $\nu \in A$ we have
   \[ \mathcal{P}_{\kappa_n, \max(b[\nu]), \max(b'[\mathcal{P}_{\lambda_n, \max(a), \max(a')}(\nu)])} B[\nu] \subseteq B'[\mathcal{P}_{\lambda_n, \max(a), \max(a')}(\nu)] \]

   We define now $Q_{n1}$ and $\langle Q_n, \leq_n, \leq^*_n \rangle$ similar to those of Chapter 1.

**Definition 4.3.4** $Q_{n1}$ consists of pairs $\langle f, g \rangle$ such that

1. $f$ is a partial function from $\kappa^{++}$ to $\lambda_n$ of cardinality at most $\kappa$
2. $g$ is a partial function from $\kappa^3$ to $\kappa_n$ of cardinality at most $\kappa$

$Q_{n1}$ is ordered by extension. Denote this order by $\leq_1$.

So, it is basically the Cohen forcing for adding $\kappa^3$ Cohen subsets to $\kappa^+$. 

**Definition 4.3.5** Set $Q_n = Q_{n0} \cup Q_{n1}$. Define $\leq^*_n = \leq_{Q_{n0}} \cup \leq_{Q_{n1}}$.

Define now a natural projection to the first coordinate:

**Definition 4.3.6** Let $p \in Q_n$. Set $(p)_0 = p$, if $p \in Q_{n1}$ and let $(p)_0 = \langle a, A, f \rangle$, if $p \in Q_{n0}$ is of the form $\langle \langle a, A, f \rangle, \langle b, B, g \rangle \rangle$.

Let $(Q_n)_0 = \{(p)_0 \mid p \in Q_n\}$.

**Definition 4.3.7** Let $p, q \in Q_n$. Then $p \leq_n q$ iff either

1. $p \leq^*_n q$
   
or
2. $p = \langle \langle a, A, f \rangle, \langle b, B, g \rangle \rangle \in Q_{n0}$, $q = \langle e, h \rangle \in Q_{n1}$ and the following hold:
   
   (a) $e \supseteq f$
   
   (b) $h \supseteq g$
(c) \( \text{dom}(e) \supseteq \text{dom}(a) \)
(d) \( e(\max(\text{dom}(a))) \in A \)
(e) for every \( \beta \in \text{dom}(a) \), \( e(\beta) = \pi_{\lambda_n,a(\max(\text{dom}(a)))} a(\beta) (e(\max(\text{dom}(a)))) \)
(f) \( \text{dom}(h) \supseteq \text{dom}(b) \)
(g) \( h(\max(\text{dom}(b))) \in B[e(\max(\text{dom}(a)))]. \)
I.e., we use \( e(\max(\text{dom}(a))) \) in order to interpret \( B \). Note that by 2d above, it is inside \( A \) and so the interpretation makes sense.
(h) for every \( \beta \in \text{dom}(b) \)
\[
h(\beta) = \pi_{\kappa_n,\max(\text{rng}(b[\nu]))} b(\beta)[\nu] (h(\max(\text{dom}(b))),
\]
where \( \nu = e(\max(\text{dom}(a))) \). Recall that we code models by ordinals.

**Definition 4.3.8** The set \( \mathcal{P} \) consists of all sequences \( p = \langle p_n \mid n < \omega \rangle \) so that

1. for every \( n < \omega \), \( p_n \in Q_n \)
2. there is \( \ell(p) < \omega \) such that
   (a) for every \( n < \ell(p) \), \( p_n \in Q_{n1} \)
   (b) for every \( n \geq \ell(p) \), \( p_n = \langle \langle a_n, A_n, f_n \rangle, \langle b_n, B_n, g_n \rangle \rangle \in Q_{n0} \)
   (c) for every \( n, m \geq \ell(p) \), \( \max(\text{dom}(a_n)) = \max(\text{dom}(a_m)) \) and \( \max(\text{dom}(b_n)) = \max(\text{dom}(b_m)) \)
   (d) for every \( n \geq m \geq \ell(p) \), \( \text{dom}(a_m) \subseteq \text{dom}(a_n) \) and \( \text{dom}(b_m) \subseteq \text{dom}(b_n) \)
   (e) for every \( n, \ell(p) \leq n < \omega \), and \( X \in \text{dom}(a_n) \) the following holds:
      for each \( k < \omega \) the set
      \[
      \{ m < \omega \mid \neg(a_m(X) \cap H(\chi^+k) \prec H(\chi^+k)) \}
      \]
      is finite.
   (f) for every \( n, \ell(p) \leq n < \omega \), and \( X \in \text{dom}(b_n) \) the following holds:
      for each \( k < \omega \) the set
      \[
      \{ m < \omega \mid \exists \nu \in A_m(\neg(b_m(X)[\nu] \cap H(\chi^+k) \prec H(\chi^+k))) \}
      \]
      is finite.
We define the orders $\leq, \leq^*$ as in [3].

**Definition 4.3.9** Let $p = \langle p_n \mid n < \omega \rangle, q = \langle q_n \mid n < \omega \rangle$ be in $\mathcal{P}$. Define

1. $p \geq q$ iff for each $n < \omega, p_n \geq q_n$
2. $p \geq^* q$ iff for each $n < \omega, p_n \geq^* q_n$

**Definition 4.3.10** Let $p = \langle p_n \mid n < \omega \rangle, q = \langle q_n \mid n < \omega \rangle \in \mathcal{P}$. Define

Finally, the equivalence relation $\leftrightarrow$ and the order $\rightarrow$ are defined on $(\mathcal{P})_0$ exactly as it was done in [1], or in Chapter 1. We extend $\rightarrow$ to $\mathcal{P}$ as follows:

**Definition 4.3.11** Let $p = \langle p_n \mid n < \omega \rangle, q = \langle q_n \mid n < \omega \rangle \in \mathcal{P}$. Set $q \rightarrow p$ iff

1. $(q)_0 \rightarrow (p)_0$
2. $\ell(p) = \ell(q)$
3. for every $n < \ell(p), p_n$ extends $q_n$
4. for every $n \geq \ell(p)$, let $p_n = \langle a_n, A_n, f_n \rangle, (b_n, B_n, g_n)$ and $q_n = \langle a'_n, A'_n, f'_n \rangle, (b'_n, B'_n, g'_n)$. Require the following:
   
   (a) $g_n \supseteq g'_n$
   (b) there is $b''_n$ such that for every $\nu \in A_n$ the following holds:
      
      i. $b''_n[\nu]$ extends $b''_n[\nu']$
      ii. $\text{dom}(b''_n) = \text{dom}(b''_n)$
      iii. $\pi''_{\kappa_n, \max(\text{dom}(a_n) \cup \text{rng}(a_n)), \max(\text{dom}(b''_n) \cup \text{rng}(b''_n))} B_n[\nu] \subseteq B'_n[\nu']$
         where $\nu' = \pi_{\lambda_n, \max(\text{dom}(a_n))} (\nu)$ and $\xi = a_n(\max(\text{dom}(a'_n))$
      iv. $\text{rng}(b''_n)[\nu'] \leftrightarrow_{k_n} \text{rng}(b''_n)[\nu'], \text{where } \nu'$ is as above and $k_n$ is the $k_n$'s member of a nondecreasing sequence converging to the infinity.
      v. $\text{rng}(b''_n)[\nu'] \uparrow \kappa^{n+1}_n = \text{rng}(b''_n)[\nu'] \uparrow \kappa^{n+1}_n$

Here is the main difference between $\rightarrow$ in the present context and those of [1] etc. In the present context we deal with assignment functions $b_n$’s which act over $\kappa_n$’s but are of cardinalities below $\kappa_n$’s (as well as the models in $\text{rng}(b_n)$ which are images of those of cardinality $\kappa^+$). Thus, assume that $n$ is fixed and
\( Z = b_n(\max(\text{dom}(b_n))), \) where \( b_n = b_n[\eta] \) is the interpretation according to some \( \eta < \lambda_n < \kappa_n. \) Then \( |Z| = (\eta^0)^{+n+1}. \) Now if we like to realize types inside \( Z, \) as it was done usually in \([1]\) etc., it may be just impossible since \( Z \) is too small and so does not contain all the types.

The way suggested here in order to overcome this difficulty, will be to use 4.3.2(10c) together with the above definition. It turns out that once working with names it is still possible to prove \( \kappa^{++}-\text{c.c.} \) of the final forcing \( \langle P, \rightarrow \rangle. \) It will be done in 4.4.5.

### 4.4 Basic Lemmas

In this section we state basic lemmas for the forcing \( \langle P, \leq, \leq^* \rangle. \) Most of the proofs just repeat those of Chapter 1 with minor adjustments.

**Lemma 4.4.1** Let \( p \in P \) and \( \langle\langle B_0^{\kappa^+}, B_1^{\kappa^+}, D^{\kappa^+}\rangle, B_1^{\kappa^+}\rangle \in G(P'). \) Then

1. for every \( \alpha \in B_1^{\kappa^+} \) there is \( q \geq^* p \) such that \( \alpha \in \text{dom}(b_n(q)) \) for all but finitely many \( n \)'s;

2. for every \( A \in B_1^{\kappa^+} \) there is \( q \geq^* p \) such that \( A \cap \kappa^{++} \in \text{dom}(a_n(q)) \) and \( A \in \text{dom}(b_n(q)) \) for all but finitely many \( n \)'s. Moreover, if \( \langle\langle A_0^{\kappa^+}, A_1^{\kappa^+}, C^{\kappa^+}\rangle, A_1^{\kappa^+}\rangle \geq \langle\langle B_0^{\kappa^+}, B_1^{\kappa^+}, D^{\kappa^+}\rangle, B_1^{\kappa^+}\rangle \) witnesses a generic suitability of \( p \) and \( A \in C^{\kappa^+}(A_0^{\kappa^+}), \) then the addition of \( A \) does not require adding of ordinals and the only models that probably will be added together with \( A \) are its images under \( \Delta \)-system type isomorphisms for triples in \( p. \)

**Lemma 4.4.2** Let \( n < \omega. \) Then \( \langle Q_n, \leq_0 \rangle \) does not add new sequences of ordinals of the length \( < \lambda_n, \) i.e. it is \( (\lambda_n, \infty) \) – distributive.

**Lemma 4.4.3** \( \langle P, \leq^* \rangle \) does not add new sequences of ordinals of the length \( < \kappa_0. \)

**Lemma 4.4.4** \( \langle P, \leq^* \rangle \) satisfies the Prikry condition.

Let us turn now to the main lemma in the present context:

**Lemma 4.4.5** \( \langle P, \rightarrow \rangle \) satisfies \( \kappa^{++}-\text{c.c.} \)
Proof.
Suppose otherwise. Work in \( V \). Let \( \langle p_\alpha \mid \alpha < \kappa^{++} \rangle \) be a name of an antichain of the length \( \kappa^{++} \). Using the strategic closure of \( \mathcal{P}' \), we find an increasing sequence

\[
\langle \langle A_0^{\kappa^+}, A_1^{\kappa^+}, C_\alpha^{\kappa^+}, A_0^{1\kappa^+} \rangle \mid \alpha < \kappa^{++} \rangle
\]

of elements of \( \mathcal{P}' \) and a sequence \( \langle p_\alpha \mid \alpha < \kappa^{++} \rangle \) so that for every \( \alpha < \kappa^{++} \) the following hold:

(a) \( \langle \langle A_0^{\kappa^+}, A_1^{\kappa^+}, C_\alpha^{\kappa^+}, A_0^{1\kappa^+} \rangle \mid \alpha < \kappa^{++} \rangle \) \( \models p_\alpha \leq \tilde{p}_\alpha \),

(b) \( \bigcup_{\beta < \alpha} A_0^{\kappa^+} = A_0^{\kappa^+} \), if \( \alpha \) is a limit ordinal,

(c) \( \kappa A_0^{\kappa^+} \subseteq A_0^{\kappa^+} \),

(d) \( A_0^{\kappa^+} \) is a successor model,

(e) \( \langle A_\beta^{\kappa^+} \mid \beta < \alpha \rangle \in A_0^{\kappa^+} \),

(f) for every \( \alpha \leq \beta < \kappa^{++} \) we have

\( C_\alpha^{\kappa^+}(A_0^{\kappa^+}) \) is an initial segment of \( C_\beta^{\kappa^+}(A_0^{\kappa^+}) \),

(g) \( p_\alpha = \langle p_{\alpha n} \mid n < \omega \rangle \),

(h) for every \( n \geq l(p_\alpha) \)

- \( A_0^{\kappa^+} \cap \kappa^{++} \) is the maximal ordinal of \( \text{dom}(a_{\alpha n}) \) and \( A_0^{\kappa^+} \cap \kappa^{++} \subseteq \text{dom}(a_{\alpha n}) \),

- \( A_0^{\kappa^+} \) is the maximal model of \( \text{dom}(b_{\alpha n}) \) and \( A_0^{\kappa^+} \subseteq \text{dom}(b_{\alpha n}) \),

where \( p_{\alpha n} = \langle (a_{\alpha n}, A_{\alpha n}, f_{\alpha n}), (b_{\alpha n}, B_{\alpha n}, g_{\alpha n}) \rangle \).

Actually this condition is the reason for not requiring the equality in (a) above.

Let \( p_{\alpha n} = \langle (a_{\alpha n}, A_{\alpha n}, f_{\alpha n}), (b_{\alpha n}, B_{\alpha n}, g_{\alpha n}) \rangle \) for every \( \alpha < \kappa^{++} \) and \( n \geq l(p_\alpha) \). Let \( \alpha < \kappa^{++} \). Fix some

\[
\langle \langle B_0^{\kappa^+}, B_1^{\kappa^+}, D_\alpha^{\kappa^+}, B_1^{\kappa^+} \rangle \mid \alpha < \kappa^{++} \rangle \leq_{\mathcal{P}'} \langle \langle A_0^{\kappa^+}, A_1^{\kappa^+}, C_\alpha^{\kappa^+}, A_0^{1\kappa^+} \rangle \mid \alpha < \kappa^{++} \rangle
\]

which witnesses a generic suitability of structure \( \text{dom}(b_{\alpha n}) \) for each \( n, l(p_\alpha) \leq n < \omega \), as in Definition 4.3.2. Note that \( B_0^{\kappa^+} \) need not be in \( C_\alpha^{\kappa^+}(A_0^{\kappa^+}) \) and even if it does, then
In particular, we have now that the central line of dom(αn, ℓ) for each n, l ∈ Aα+1, such that

\[ \text{swt}(\langle A^{α+}_n, A^{κ+}_{α+1}, C^{α+}_{α+1}, A^{1κ+}_{α+1}, E_n, ..., E_m \rangle) \]

as in the definition of the order of \( \mathcal{P}' \) (Chapter 1, 1.15).

By Lemma 4.4.1 it is possible to add all \( E_i \) (i.e., the one starting with \( E_m \), then \( E_{m-1} \), ..., and finally \( E_1 \)) to \( \text{dom}(\alpha_n) \) (and the corresponding to it under \( a_{\alpha_n} \) to \( \text{rng}(\alpha_{\alpha_n}) \)). Denote the result still by \( a_{\alpha_n} \).

Finally, \( \langle A^{0κ+}_n, A^{1κ+}_{α+1}, C^{α+}_{α+1}, A^{1κ+}_{α+1} \rangle \) will witness a generic suitability of structure \( \text{dom}(\alpha_{\alpha_n}) \) for each \( n, l(p_n) \leq n < ω. \)

In particular, we have now that the central line of \( \text{dom}(\alpha_{\alpha_n}) \) is a part of \( C^{κ+}_{α+1}(A^{0κ+}_{α+1}) \) and \( A^{0κ+} \) is on it, for every \( n, l(p_n) \leq n < ω. \)

Shrinking if necessary, we assume that for all \( α, β < κ^+ \) the following holds:

1. \( ℓ = l(p_n) = l(p_β) \),
2. for every \( n < ℓ, \ p_{α_n} \) and \( p_β \) are compatible in \( Q_{n1} \) i.e. \( p_{α_n} \cup p_β \) is a function,
3. for every \( n, \ l ≤ n < ω, \ \langle \text{dom}(f_{α_n}) | α < κ^{++} \rangle \) and \( \langle \text{dom}(g_{α_n}) | α < κ^{++} \rangle \) form a \( \Delta \)-system with the kernel contained in \( A^{0κ+}_0 \),
4. for every \( n, \ ω > n ≥ ℓ, \ \text{rng}(α_{α_n}) = \text{rng}(α_{β_n}) \),
5. for every \( n, \ ω > n ≥ ℓ, \ A_{α_n} = A_{β_n} \),
6. for every \( n, \ ω > n ≥ ℓ, \ η ∈ A_{α_n}, \ \text{rng} b_{α_n}[η] = \text{rng} b_{β_n}[η] \),
7. for every \( n, \ ω > n ≥ ℓ, \ η ∈ A_{α_n}, \ B_{α_n}[η] = B_{β_n}[η] \).

Shrink now to the set \( S \) consisting of all the ordinals below \( κ^{++} \) of cofinality \( κ^+ \). Let \( α \) be in \( S \). For each \( n, ℓ ≤ n < ω, \) there will be \( β(α, n) < α \) such that

\[ \text{dom}(b_{α_n}) \cap A^{0κ+}_α \subseteq A^{0κ+}_β(α, n). \]

Just recall that \( \text{dom}(b_{α_n}) \) is not actually a name and \( |\text{dom}(b_{α_n})| < λ_n \). Shrink \( S \) to a stationary subset \( S^* \) so that for some \( α^* < \min S^* \) of cofinality \( κ^+ \), we will have \( β(α, n) < α^* \),

102
whenever $\alpha \in S^*, \ell \leq n < \omega$. Now, the cardinality of $A_{\alpha}^{0^{<\omega}}$ is $\kappa^+$. Hence, shrinking $S^*$ if necessary, we can assume that for each $\alpha, \beta \in S^*, \ell \leq n < \omega$

$$\text{dom}(\overline{b}_{\alpha n}) \cap A_{\alpha}^{0^{<\omega}} = \text{dom}(\overline{b}_{\beta n}) \cap A_{\beta}^{0^{<\omega}}.$$ 

Let us add $A_{\alpha}^{0^{<\omega}}$ to each $p_\alpha$ with $\alpha \in S^*$.

By 4.4.1(2), we can add it without adding ordinals and the only other models that probably were added are the images of $A_{\alpha}^{0^{<\omega}}$ under $\Delta$-system type isomorphisms. Denote the result for simplicity by $p_\alpha$ as well.

Let now $\beta < \alpha$ be ordinals in $S^*$. We claim that $p_\beta$ and $p_\alpha$ are compatible in $\langle P, \to \rangle$.

First extend $p_\beta$ by adding $A_{\beta+2}^{0^{<\omega}}$. This will not add other additional models or ordinals except the images of $A_{\beta+2}^{0^{<\omega}}$ under isomorphisms to $p_\alpha$, as was remarked above.

Let $p$ be the resulting extension. Denote $p_\beta$ by $q$. Assume that $\ell(q) = \ell(p)$. Otherwise just extend $q$ in an appropriate manner to achieve this. Let $n \geq \ell(p)$ and $p_n = \langle \langle a_n, A_n, f_n \rangle, \overline{b}_n, \overline{B}_n, g_n \rangle$. Let $q_n = \langle \langle a'_n, A'_n, f'_n \rangle, \langle b'_n, B'_n, g'_n \rangle \rangle$. Without loss of generality we may assume that the ordinal $a_n(A_{\beta+2}^{0^{<\omega}} \cap \kappa^{++})$ is $\kappa_n$-good with $k_n \geq 5$. Just increase $n$ if necessary.

Realize the $k_n - 1$-type of $\text{rng}(a'_n)$ below $a_n(A_{\beta+2}^{0^{<\omega}} \cap \kappa^{++})$ over $a_n((A_{\beta+2}^{0^{<\omega}} \cap \kappa^{++}) \cap \text{dom}(a_n))$, i.e. above the common part on $\kappa^{++}$. Denote the ordinal corresponding to $\max(\text{rng}(a'_n))$ in this realization by $\delta'$. Note that $a_n(A_{\beta+1}^{0^{<\omega}} \cap \kappa^{++})$ and $\delta'$ have the same projection to the common part $a_n((A_{\beta+2}^{0^{<\omega}} \cap \kappa^{++}) \cap \text{dom}(a_n))$.

Fix now $\eta \in A_n$. Set $\eta' = \pi_{\lambda_n, \max(\text{rng}(a_n)), \delta'}(\eta)$.

Consider $\overline{b}_n(A_{\alpha+1}^{0^{<\omega}})[\eta]$. Again we can assume that it is an elementary submodel of $\mathcal{A}_{n, k_n}$ with $k_n \geq 5$ (and $k_n$ does not depend on $\eta$). Now we have

$$\eta' = \pi_{\lambda_n, \max(\text{rng}(a_n)), \delta'}(\eta) < \eta \text{ and } A_{\beta+2}^{0^{<\omega}} \in C_{\kappa^{++}}(A_{\alpha+1}^{0^{<\omega}}).$$

Hence, by Definition 4.3.2(10c), the $k_n - 1$-type realized by $\overline{b}_n(A_{\alpha+1}^{0^{<\omega}})[\eta']$ is in $\overline{b}_n(A_{\beta+2}^{0^{<\omega}})[\eta]$, as well as the $k_n - 1$-type realized by $\overline{b}_n(A_{\alpha+1}^{0^{<\omega}})[\eta']$ over $\overline{b}_n(A_{\beta+2}^{0^{<\omega}} \cap \text{dom}(\overline{b}_n))[\eta]$, i.e. the common part of of the conditions. Realize the $k_n - 1$-type of $\overline{b}_n(A_{\alpha+1}^{0^{<\omega}})[\eta']$ over $\overline{b}_n(A_{\beta+2}^{0^{<\omega}} \cap \text{dom}(\overline{b}_n))[\eta]$ in $\overline{b}_n(A_{\alpha+1}^{0^{<\omega}})[\eta]$.

Doing the above for each $\eta \in A_n$ will produce a condition $p_n^* \geq p_n$ with $a_n \to p_n^*$ as in Chapter 1.
4.5 The resulting PCF structure

Force with $\langle \mathcal{P}, \rightarrow \rangle$. Let $G(\mathcal{P})$ be a generic set. By the lemmas above no cardinals are collapsed. Let $\langle \nu_n \mid n < \omega \rangle$ denotes the diagonal Prikry sequence added for the normal measures of the extenders $\langle E_{\lambda_n} \mid n < \omega \rangle$ and $\langle \rho_n \mid n < \omega \rangle$ those for $\langle E_{\kappa_n} \mid n < \omega \rangle$. We can deduce now the following conclusion:

**Theorem 4.5.1** The following hold in $V[G(\mathcal{P}'(\theta')), G((\mathcal{P}'(\theta)), G(\mathcal{P}])$:

1. $\text{cof}(\prod_{n<\omega} \nu_n^{+n+2} / \text{finite}) = \kappa^{++}$
2. $\text{cof}(\prod_{n<\omega} \rho_n^{+n+2} / \text{finite}) = \kappa^{+3}$
3. For every unbounded subset $a$ of $\kappa$ consisting of regular cardinals and disjoint to both $\{\nu_n^{+n+2} \mid n < \omega\}$ and $\{\rho_n^{+n+2} \mid n < \omega\}$, for every ultrafilter $D$ over $a$ which includes all co-bounded subsets of $\kappa$ we have
   $$\text{cof}(\prod a/D) = \kappa^+$$

**Proof.** Items (1) and (2) follow easily from the construction. Thus, for (1), take the increasing (under the inclusion) enumeration $\langle X_\tau \mid \tau < \kappa^{++} \rangle$ of the chain of models given by $G(\mathcal{P}'(\kappa^{++}))$. Define a scale of functions $\langle F_\tau \mid \tau < \kappa^{++} \rangle$ in the product $\prod_{n<\omega} \nu_n^{+n+2}$ as follows: let for each $\tau < \kappa^{++}$
   $$F'_\tau(n) = f_n(X_\tau), \text{ if } f_n(X_\tau) < \nu_n^{+n+2}$$
   and
   $$F'_\tau(n) = 0, \text{ otherwise},$$
   where for some $p = \langle p_k \mid k < \omega \rangle \in G(\mathcal{P})$ with $\ell(p) > n$ we have $f_n$ as the first coordinate of $p_n$. Now let $\langle Y_\tau \mid \tau < \kappa^{++} \rangle$ be the subsequence of $\langle F'_\tau \mid \tau < \kappa^{++} \rangle$ consisting of all $F'_\tau$ which are not in $V$.

   Similar, for (2), take the increasing (under the inclusion) enumeration $\langle Y_\tau \mid \tau < \kappa^{+3} \rangle$ of the chain of models of cardinality $\kappa^{++}$ given by $G(\mathcal{P}')$. Define a scale of functions $\langle H_\tau \mid \tau < \kappa^{++} \rangle$ in the product $\prod_{n<\omega} \rho_n^{+n+2}$ as follows:
   $$H'_\tau(n) = g_n(Y_\tau), \text{ if } g_n(Y_\tau) < \rho_n^{+n+2}$$
   and
   $$H'_\tau(n) = 0, \text{ otherwise},$$
   for some $p = \langle p_k \mid k < \omega \rangle \in G(\mathcal{P})$ with $\ell(p) > n$. We can deduce now the following conclusion:

Theorem 4.5.1 The following hold in $V[G(\mathcal{P}'(\theta')), G((\mathcal{P}'(\theta)), G(\mathcal{P}])$:

1. $\text{cof}(\prod_{n<\omega} \nu_n^{+n+2} / \text{finite}) = \kappa^{++}$
2. $\text{cof}(\prod_{n<\omega} \rho_n^{+n+2} / \text{finite}) = \kappa^{+3}$
3. For every unbounded subset $a$ of $\kappa$ consisting of regular cardinals and disjoint to both $\{\nu_n^{+n+2} \mid n < \omega\}$ and $\{\rho_n^{+n+2} \mid n < \omega\}$, for every ultrafilter $D$ over $a$ which includes all co-bounded subsets of $\kappa$ we have
   $$\text{cof}(\prod a/D) = \kappa^+$$

Proof. Items (1) and (2) follow easily from the construction. Thus, for (1), take the increasing (under the inclusion) enumeration $\langle X_\tau \mid \tau < \kappa^{++} \rangle$ of the chain of models given by $G(\mathcal{P}'(\kappa^{++}))$. Define a scale of functions $\langle F_\tau \mid \tau < \kappa^{++} \rangle$ in the product $\prod_{n<\omega} \nu_n^{+n+2}$ as follows: let for each $\tau < \kappa^{++}$
   $$F'_\tau(n) = f_n(X_\tau), \text{ if } f_n(X_\tau) < \nu_n^{+n+2}$$
   and
   $$F'_\tau(n) = 0, \text{ otherwise},$$
   where for some $p = \langle p_k \mid k < \omega \rangle \in G(\mathcal{P})$ with $\ell(p) > n$ we have $f_n$ as the first coordinate of $p_n$. Now let $\langle Y_\tau \mid \tau < \kappa^{++} \rangle$ be the subsequence of $\langle F'_\tau \mid \tau < \kappa^{++} \rangle$ consisting of all $F'_\tau$ which are not in $V$.

   Similar, for (2), take the increasing (under the inclusion) enumeration $\langle Y_\tau \mid \tau < \kappa^{+3} \rangle$ of the chain of models of cardinality $\kappa^{++}$ given by $G(\mathcal{P}')$. Define a scale of functions $\langle H_\tau \mid \tau < \kappa^{++} \rangle$ in the product $\prod_{n<\omega} \rho_n^{+n+2}$ as follows:
   $$H'_\tau(n) = g_n(Y_\tau), \text{ if } g_n(Y_\tau) < \rho_n^{+n+2}$$
   and
   $$H'_\tau(n) = 0, \text{ otherwise},$$
where for some \( p = \langle p_k | k < \omega \rangle \in G(\mathcal{P}) \) with \( \ell(p) > n \) we have \( g_n \) as the second coordinate of \( p_n \). Let \( \langle H_\tau | \tau < \kappa^{++} \rangle \) be the subsequence of \( \langle H'_\tau | \tau < \kappa^{++} \rangle \) consisting of all \( H'_\tau \)’s which are not in \( V \).

Let us turn to (3) which requires a more delicate analyses of the forcing \( \langle \mathcal{P}, \rightarrow \rangle \). We deal with

\[
\text{cof}(\prod_{n<\omega} \rho_n^{+n+1}/\text{finite }).
\]

The rest of cases are similar or just standard. The crucial observation here is that given \( \langle (a_n, A_n, \sim_{n}), (b_n, B_n, g_n) \rangle \in Q_{n_0} \), for some \( n < \omega \), it is impossible to change \( \text{rng}(b_n)[\nu] \upharpoonright \kappa^{+n+1} \) by passing to an equivalent condition, for any \( \nu \in A_n \). Just the definition 4.3.11(4(b)v) explicitly requires this.

This means, in particular that

\[
\text{cof}(\prod_{n<\omega} \rho_n^{+n+1}/\text{finite }) = \text{cof}(\prod_{n<\omega} \kappa_n^{+n+1}/\text{finite }),
\]

where the connection is provided by \( b_n \)’s. But note that the cofinality of the last product is \( \kappa^+ \), since every function their can be bounded by an old function. So we are done.

\[\square\]

### 4.6 Dropping cofinalities-gap 3 with infinite repetitions

We study dropping cofinalities and allow infinite repetitions. Here we deal with the simplest case-gap 3.

Let \( \lambda_0 < \kappa_0 < \lambda_1 < \kappa_1 < \ldots < \lambda_n < \kappa_n < \ldots (n < \omega) \) be an increasing sequence of cardinals with a limit \( \kappa \).

Assume the following:

- \( \kappa_n \) is \( \kappa_n^{+n+2} \) - strong as witnessed by an extender \( E_{\kappa_n} \), for every \( n < \omega \)
- \( \lambda_n \) is \( \lambda_n^{+n+2} \) - strong as witnessed by an extender \( E_{\lambda_n} \), for every \( n < \omega \)

Our aim will be to make \( 2^\kappa = \kappa^{+3} \), but so that for each \( n < \omega \) the cofinality over \( \kappa_n \) that corresponds to \( \kappa^{++} \) drops down to each of \( \lambda_m \)'s with \( m < n \). In particular we will have a drop to \( \lambda_0 \) at each \( n < \omega \).

It is a bit simpler probably to consider the setting with only a drop to \( \lambda_0 \) occurs infinitely many times, i.e. for every \( m > 0 \) a drop to \( \lambda_m \) occurs only at \( \kappa_m \). Then \( \lambda_0 \) will be used
infinitely many times and all the rest only once. It will be possible then to make a non-direct extension at \( \lambda_0 \) and this will bring the situation basically to the usual dropping cofinality forcing.

If each of \( \lambda_n \)'s appears infinitely many times, then the previous trick of taking non-direct extension over \( \lambda_0 \) will not work. Just we cannot take non-direct extensions at infinitely many places.

All \( \lambda_n \)'s will correspond to \( \kappa^{++} \) and \( \kappa_n \)'s to \( \kappa^{+3} \). More precisely indiscernibles for \( \lambda^{+n+2}_n \)'s and for \( \kappa^{n+2}_n \)'s will correspond to \( \kappa^{++} \) and to \( \kappa^{+3} \) respectively.

It is possible, using the same method, to replace \( n \) dropping points \( \langle \lambda_m \mid m \leq n \rangle \) for \( \kappa_n \) with any finite number. If one likes to replace it with infinitely many, i.e. some strong enough cardinals \( \langle \lambda_{nm} \mid m < \omega \rangle \) additional assumption are needed on \( \Lambda_n := \bigcup_{m<\omega} \lambda_{nm} \) even if \( \kappa_n < \lambda_{n+1,0} \). Just otherwise the indiscernibles for \( \lambda^{+n+2}_n \) \( (m < \omega) \) will correspond to \( \Lambda^{+}_n \) and \( \Lambda^{+}_n \)'s correspond to \( \kappa^+ \) and everything breaks down. The problem here is that once a non-direct extension is taken over \( \kappa_n \), then \( \langle \lambda_{nm} \mid m < \omega \rangle \) starts to be isolated from the part above \( \kappa_n \). Some connection of this sort is needed for example in order to show the Prikry condition. Existence of strong enough cardinals between \( \Lambda_n \) and \( \kappa_{n+1} \) allows to generalize the present arguments to such situation. This will be elaborated further.
Let us turn now to the forcing notions.

Force first with the preparation forcing $P'(\kappa^3)$ followed by $P'(\kappa^{++})$ of Chapter 1. It is possible instead of forcing with $P(\kappa^{++})$ just to take the projection of a generic for $P'(\kappa^3)$ to $\kappa^{++}$, i.e. intersect each model there with $\kappa^{++}$.

Let $G(\kappa^3)$ and $G(\kappa^{++})$ be the corresponding generic subsets. Work in $V[G(\kappa^3), G(\kappa^{++})]$. We shall redefine the forcing of Section 4.4.

The first small change (actually relevant to all short extenders forcings) will be as follows. Given a condition $p = \langle p_n | n < \omega \rangle$, $p_n = \langle a_n, A_n, f_n \rangle$, for each $n \geq \ell(p)$. We require that

1. for each $n < \ell(p)$, if $X \in \text{dom}(p_n)$, then starting with some $m > n$ we have $X \in \text{dom}(a_m)$.

2. for each $n \geq \ell(p)$, if $X \in \text{dom}(f_n)$, then starting with some $m > n$ we have $X \in \text{dom}(a_m)$.

This change prevents appearance of old $\omega$ sequences among those produced by a generic object.

Recall that the cardinalities of $\text{dom}(p_n)$ and $\text{dom}(f_n)$ are at most $\kappa$, as well as the cardinality of $\bigcup_{\ell(p) \leq k < \omega} \text{dom}(a_k)$. So it is always possible to spread $\kappa$-many things among $\text{dom}(a_k)$'s.

Fix some $n < \omega$.

**Definition 4.6.1** Let $Q_{n0}$ be the set consisting of pairs

$$\langle \langle a_m, A_m, f_m \rangle | m \leq n \rangle$$

so that:

for each $m \leq n$

1. $f_m$ is partial function from $\kappa^2$ to $\lambda_m$ of cardinality at most $\kappa$.

2. There is a suitable generic structure $\langle \langle X, Y \rangle, C, \in, \subseteq \rangle$ for $G(\kappa^{++})$ of cardinality less than $\lambda_m$ such that $a_m$ is an order preserving from $X \cup Y$ (actually here for $\kappa^+$ we have that $X$ itself consists of ordinals and $Y$ is unneeded).

3. $a_m(\text{max}(X)) = \text{max}(\text{rng}(a_m))$ is above all the elements of $\text{rng}(a_m)$ in the order of the extender $E_{\lambda_m}$.

4. $\text{dom}(a_m) \cap \text{dom}(f_m) = \emptyset$.

5. $A_m \in E_{\lambda_m, a_m(\text{max}(X))}$
6. $\min(A_m) > |\text{dom}(a_m)|$

7. For every $\alpha, \beta, \gamma \in \text{rng}(a_m)$ we have

$$\alpha \geq_{E_{\lambda_m}} \beta \geq_{E_{\lambda_m}} \gamma \implies \pi_{\lambda_m,\alpha,\beta}(\rho) = \pi_{\lambda_m,\beta,\gamma}(\pi_{\lambda_m,\alpha,\beta}(\rho))$$

for every $\rho \in \pi''_{\lambda_m,\text{max}(\text{rng}(a_m)),\alpha}(A_m)$.

8. For every $\alpha > \beta$ in $\text{rng}(a_m)$ and $\rho \in A_m$

$$\pi_{\lambda_m,\text{max}(\text{rng}(a_m)),\alpha}(\rho) > \pi_{\lambda_m,\text{max}(\text{rng}(a_m)),\beta}(\rho).$$

Let us turn now to the second component of a condition, i.e. to $\langle \tilde{b}, \tilde{B}, \tilde{g} \rangle$. Main differences (and complications) appear in this part-namely in the assignment function $\tilde{b}$.

9. $\tilde{b}$ is a name, depending on $\langle \langle a_m, A_m \rangle \mid m \leq n \rangle$, of a partial function of cardinality less or equal than $\bigcup_{m \leq n} \lambda_m$.

The following conditions are satisfied:

(a) (Domain) There is a generic suitable structure $\langle \langle X, Y \rangle, C, \in, \subseteq \rangle$ for $G(\kappa^+)$ of cardinality less than or equal than $\bigcup_{m \leq n} \lambda_m$ such that

i. $\text{dom}(\tilde{b}) = X \cup Y$;

ii. for every $Z \in X$ there is $m \leq n$ such that $Z \cap \kappa^{++}$ is in $\text{dom}(a_m)$.

(b) (Maximal model) $\text{max}(X)$ is a maximal (under $\in$) model in $\text{dom}(\tilde{b})$

Here its image will not necessary be the maximal model of the range. The complication due to the fact that now we will have models of different sizes in the range of $b$ and $\text{max}(X)$ may correspond to a model of a size $\lambda_m$ for some $m < n$. In this case the following situation will be allowed:

$$Z_1 \in Z_2 \in Z \text{ and } Z_1 \notin Z.$$

The choice of a size of $\tilde{b}(A)$, for $A \in \text{dom}(\tilde{b}) \cap X$, will be determined by $A \cap \kappa^{++}$. Thus we require that there is a splitting of $\kappa^{++}$ into intervals (determined by the condition) which rule the correspondence of sizes.
(c) (Splitting into intervals) There is a disjoint partition of $\kappa^{++}$ into intervals $\langle s_i \mid i < \delta \rangle$, for some $\delta < \lambda_n$, such that

- for each $i < \delta$ there is a unique $m(i)$ such that $\lambda_{m(i)}$ is the index of $\lambda_{m(i)}$ corresponding to size of models in the sense of the next condition;
- let $A \in \text{dom}(b)$ be a model of cardinality $\kappa^+$ on the central line. Denote by $i(A)$ the unique $i < \delta$ such that $A \cap \kappa^{++}$ belongs $s_i$. $b(A)$ will be a model of size less than $\lambda_{m(i(A))}$.

(d) (More on the maximal model) The name $b(A)$ can depend on all $\lambda_k \mid k \leq n$. But we require that the image of the maximal model $\text{max}(X)$ depends only on $\lambda_{m(i(A))}$. This is needed for the chain condition argument.

Note that $b(\text{max}(X))$ need not even contain every model of $\text{rng}(b)$ even of cardinality $\lambda_{m(i(\text{max}(X)))}$.

On the other hand model in the range (of a bigger size) can refer to ones of a smaller sizes and then the last stop to be names for $\lambda_i$’s corresponding to their size.

Suppose for simplicity that $n = 1$. Then we have only $\lambda_0$ and $\lambda_1$. So models over $\kappa_1$ can have sizes $< \lambda_0$ and $< \lambda_1$.

A non-pure extension over $\lambda_0$ results in a condition over $\kappa_1$ in which $b$ acts in order preserving (i.e. $\in$ preserving) fashion only over the intervals corresponding to $\lambda_1$. The behavior on the intervals which correspond to $\lambda_0$ is like the function $g$ of the condition, i.e. no order preservation is required. The number of models then is not $\kappa$ like in $g$, but rather $< \lambda_1$.

If a non-pure extension is made over $\lambda_1$, then we make such extension also over $\lambda_0$, $\kappa_0$ and $\kappa_1$.

(e) (Weak order preserving condition) Let $A, B$ be in dom$(b)$. If $A \in B$, then $b(A) \in b(B)$ (forced by the empty condition) or there is $C \in B, C \in \text{dom}(b)$, $C \cap \kappa^{++}$ in an interval corresponding to $\lambda_1$ and $b(A) \in b(C) \in b(B)$ (forced by the empty condition).

(f) Suppose that $Z \in$ and $Z \cap \kappa^{++}$ in the interval corresponding to $\lambda_1$. Then $b(Z)$ depends only on $\lambda_1$, i.e. it is a name in the forcing over $\lambda_1$ without the forcing over $\lambda_0$.

(g) (Inclusion condition 1)
Suppose that $\max(X) \cap \kappa^{++}$ in the interval corresponding to $\lambda_1$.
Let $\eta, \eta' \in A_1, \eta < \eta'$. Then

- $\bar{b}(\max(X))[\eta] \in \bar{b}(\max(X))[\eta']$,
- if $Z \in X \cap C(\max(X))$, $Z \cap \kappa^{++}$ in the interval corresponding to $\lambda_1$ and

$$\pi_{\lambda_0, \max \operatorname{rng}(a), a(Z \cap \kappa^{++})}([\eta']) > \eta,$$

then either

$$\bar{b}(\max(X))[\eta] \in \bar{b}(Z)[\eta']$$

or

the $k$-type realized by $\bar{b}(\max(X))[\eta] \cap H(\chi^k)$ is in $\bar{b}(Z)[\eta']$, where $k < \omega$ is the least such that $\bar{b}(Z)[\eta'] \in H(\chi^{k+1})$.

The same holds over any element of $\bar{b}(Z)[\eta']$, i.e. $tp_k(z, \bar{b}(\max(X))[\eta] \cap H(\chi^k)) \in \bar{b}(Z)[\eta']$, for any $z \in \bar{b}(Z)[\eta']$.

We require in addition that this $k > 2$.

Let us allow the above also if $\bar{b}(Z)[\eta'] \subseteq H(\chi^\omega)$. In this case we take $k$ to be any natural number above 2 and require that once we go up to the higher levels then corresponding $k$’s increase (with $n$).

We cannot in general require only that

$$\bar{b}(\max(X))[\eta] \in \bar{b}(Z)[\eta']$$

since the sequence $C$ of a new generic suitable structure may go not through the old maximal model. But still having the type inside $Z$ will suffice.

Note that given $\eta' \in A_1$ the number of possibilities for $\eta \in \eta' \cap A_1$ is bounded by $(\eta')^{+n+1}$, as $\eta' < (\eta')^{+n+2}$.

(h) If $Z \in X$ and $Z \cap \kappa^{++}$ is in the interval corresponding to $\lambda_0$, then either

i. $\bar{b}(Z)$ does not depend on $\lambda_1$.
   In this case we require that there is no models corresponding to $\lambda_1$ below $Z$. Or

ii. there is $Z' \in X \cap C(Z)$ with $Z' \cap \kappa^{++}$ in the interval corresponding to $\lambda_1$ such that the empty condition forces “$\bar{b}(Z') \in \bar{b}(Z)$”. Moreover, if $\rho_1, \rho_2 \in A_1$ and $\pi_{\lambda_1, \max \operatorname{rng}(a_1), a(Z' \cap \kappa^{++})}([\rho_1]) = \pi_{\lambda_1, \max \operatorname{rng}(a_1), a(Z' \cap \kappa^{++})}([\rho_2])$, then for every $\nu \in A_0$ we have $\bar{b}(Z)[\nu, \rho_1] = \bar{b}(Z)[\nu, \rho_2]$.  

110
The intuition behind this condition is that the number of types inside a model of cardinality below $\lambda_0$ is too small to include all the types that may be generated by picking different indiscernibles for $\lambda_1$. In order to insure the chain condition will put together two conditions say by realizing the type of one with smaller index (in the increasing chain of $\kappa^{++}$-many) inside an other with a bigger index. This done as follows: first a model from the central line above the common part which includes the low condition and below the upper one (except the kernel) should be added. If $Z$ is inside it, then it is in the common part and the condition below takes care of such situation. If $Z$ is not inside, then such model is in $Z$ (since they are on the central line). In this situation, it is enough to preserve on the side of the images the order ($\in$) only in a weak sense (see the corresponding condition above). This is easy since the cardinality of the image of $Z$ is above $\lambda_0$.

If there were not only $\lambda_0$ and $\lambda_1$, rather an infinite sequence, then still it possible to play with this weak order preservation. Thus once we deal with a model of certain cardinality (i.e. all its interpretations in given cardinality) take a model of a bigger cardinality which includes all such interpretations, and as a name depends only on indiscernibles corresponding to its cardinality. Now we are able to add a model of smaller cardinality as a name which depends only on the last model of this bigger cardinality.

(i) (Inclusion condition 0)

Suppose that $\max(X) \cap \kappa^{++}$ in the interval corresponding to $\lambda_0$.

Let $\eta, \eta' \in A_0, \eta < \eta', \xi \in A_1$. Then

- $b(\max(X))[\eta, \xi] \in b(\max(X))[\eta', \xi]$,
- if $Z \in X \cap C(\max(X))$, $Z \cap \kappa^{++}$ in the interval corresponding to $\lambda_0$, the maximal model in $C(\max(X))$ which corresponds to $\lambda_1$ belongs to $Z$ and

$$\pi_{\lambda_0, \max(\text{rng}(a_0), a(z \cap \kappa^{++}))(\eta')} > \eta,$$

then either

$$b(\max(X))[\eta, \xi] \in b(Z)[\eta', \xi]$$

or the $k$-type realized by $b(\max(X))[\eta, \xi] \cap H(\chi^k)$ is in $b(Z)[\eta', \xi]$, where $k < \omega$ is the least such that $b(Z)[\eta', \xi] \subseteq H(\chi^{k+1})$.

The same holds over any element of $b(Z)[\eta', \xi]$, i.e. $tp_k(z, b(\max(X))[\eta, \xi] \cap$
\[ H(\chi^+) \in \mathcal{b}(Z)[\eta', \xi], \text{ for any } z \in \mathcal{b}(Z)[\eta', \xi]. \]

We require in addition that this \( k > 2 \).

Let us allow the above also if \( \mathcal{b}(Z)[\eta', \xi] \subseteq H(\chi^+) \). In this case we take \( k \) to be any natural number above 2 and require that once we go up to the higher levels then corresponding \( k \)'s increase (with \( n \)).

(j) \( Y \cap \text{dom}(g) = \emptyset \).

(k) For every \( \alpha \in Y \) and \( \eta \in A_1, \xi \in A_0 \)

i. \( \mathcal{b}[\xi, \eta](\alpha) \) is a model of cardinality \( \kappa_+^{n+1} \),

ii. \( \kappa_+^{n+1} \subseteq \mathcal{b}[\xi, \eta](\alpha) \),

iii. \( \text{cof}(\sup(\mathcal{b}[\xi, \eta](\alpha) \cap \kappa_+^{n+2})) = (\eta^0)^{+n+2} \) or it is \( (\xi^0)^{+n+2} \).

Note that all the cardinals \( \kappa_n, ..., \kappa_+^{n+1} \) will correspond here to \( \kappa^+ \). So, we need to drop down to the indiscernibles \( (\xi^0)^{+n+2} \) or \( (\eta^0)^{+n+2} \) in order to get to \( \kappa^{++} \).

Next, let us address \( \mathcal{b}' \). First we explain the purpose of introducing it.

Thus let \( \alpha \in Y \cap \text{dom}(\mathcal{b}) \), \( \text{cof}(\alpha) = \kappa^{++} \) and \( \mathcal{b}(\alpha) \) is forced to have a cofinality which corresponds to the indiscernible for \( \lambda_0^{+n+2} \) (similar, it may be a model from a part of the partition corresponding to \( \lambda_0 \)). In such a case \( \text{dom}(\mathcal{b}') \) may contain increasing sequences of models of each size \( \kappa^+ \) with unions bounded in \( \alpha \). On the other hand the images are unbounded in \( \mathcal{b}(\alpha) \). Note that the order preserving implies that \( \text{dom}(\mathcal{b}) \) may contain at most one of such sequences. Now, it is necessary for the chain condition of the forcing to be able to put together two conditions both with such \( \alpha \) inside but having in their \( b \)'s different sequences of the type above.

Also suppose that a non-pure extension was made at \( \lambda_0 \) and the central piste reflects into \( \alpha \). We need to allow a possibility of being unbounded in \( \alpha \), in order to keep \( \lambda_1 \) closure of the forcing. Assume that we have a condition of this type (i.e. models corresponding to \( \lambda_1 \) are unbounded in \( \alpha \)) and we like to extend the central piste. How to reflect an extension to \( \alpha \)? In this case we just move the previous cofinal in \( \alpha \) sequence (or its part that interferes with the new one) to \( b' \) and replace it by a new one.

So the role of \( b' \) is to allow to keep such different sequences inside a single condition. Further in the definition of extensions we will allow change \( b \) by replacing the sequence to \( \alpha \) which is inside \( b \) by one from \( b' \).

At the next level \( n + 1 \) all models which appear in \( b' \) will be required to appear
in \( \text{dom}(b) \) of \( n + 1 \)-th level, and so will have different images.

(1) \( \text{dom}(b^\prime) \subseteq X \cup Y \).

i. If \( \alpha \in \text{dom}(b^\prime) \), then for each \( \xi \in A_0, \eta \in A_1 \) we have \( \text{cof}(\text{sup}(b[\xi, \eta](\alpha) \cap \kappa_n^{++2})) = (\zeta^0)^{++n+2} \).

ii. If \( Z \in \text{dom}(b^\prime) \), then for each \( \xi \in A_0, \eta \in A_1 \) we have \( \text{cof}(\text{sup}(b[\xi, \eta](Z) \cap \kappa_n^{++2})) < (\zeta^0)^{++n+2} \).

iii. For every \( w \in \text{dom}(b^\prime) \) (an ordinal or a model),

A. \( b^\prime(w) \) is a function with domain a tree of sequences of models each of them belongs to \((X \cup Y) \cap w\).

B. \( \text{rng}(b^\prime(w)) \) is a tree of models over \( \kappa_n \) with the set of their sup’s unbounded in \( b(w) \).

C. \( \text{dom}(b) \cap \bigcup_{w \in \text{dom}(b^\prime)} \text{dom}(b^\prime(w)) = \emptyset \).

This condition insure that a same model does not correspond to different ones via \( b \) together with \( b^\prime \).

D. If \( b \upharpoonright w \) is replaced by one of branches of \( b^\prime(w) \) (i.e. if \( t \) is such a branch, then we take the last model \( Z \) of the central line of \( b \upharpoonright w \) which is below the first model of the central line of \( t \) and replace \( b \upharpoonright w \) by \( (b \upharpoonright Z) \upharpoonright t \), then the changed \( b \) will share the requirements on \( b \) stated above.

E. Suppose that \( w \) is not limit of elements of \( \text{dom}(b) \). Let \( w^* \) be its immediate predecessor. Then for every \( \xi, \xi' \in A_0, \eta, \eta' \in A_1 \) with \( \xi < \xi' \) and \( \eta \leq \eta' \) we require the following:

if \( b^\prime(w^*)[\xi, \eta] = b^\prime(w^*)[\xi', \eta'] \), then every \( t \in \text{dom}(b^\prime(w)[\xi, \eta]) \) we have \( t \in b^\prime(w)[\xi', \eta'] \) and \( (b^\prime(w)[\xi, \eta])(t) = (b^\prime(w)[\xi', \eta'])(t) \).

If \( w \) is the least element of \( \text{dom}(b) \), then every \( t \in \text{dom}(b^\prime(w)[\xi, \eta]) \) we have \( t \in b^\prime(w)[\xi', \eta'] \) and \( (b^\prime(w)[\xi, \eta])(t) = (b^\prime(w)[\xi', \eta'])(t) \).

Similar if \( w^* \) is any element \( \text{dom}(b) \), \( t \in \text{dom}(b^\prime(w^*))[\xi, \eta]) \) and \( w \in w^* \cap \text{dom}(b) \) has an immediate predecessor \( w^* \) (or just the least element in which case \( w^* \) is unneeded) such that \( b^\prime(w^*)[\xi, \eta] = b^\prime(w^*)[\xi', \eta'] \), then \( t \in b^\prime(w^*)[\xi', \eta'] \) and \( (b^\prime(w^*)[\xi, \eta])(t \upharpoonright \text{sup}(w)) = (b^\prime(w^*)[\xi', \eta'])(t \upharpoonright \text{sup}(w)) \).

This property allows us to prove \( \kappa^{++ \text{-c.c.}} \) of the final forcing. Thus we arrange first the situation where \( \xi < \xi' \) and \( \eta \leq \eta' \) just as in the ordi-
nary gap-2 forcing. Now over $\kappa_n$’s run the argument of 4.4. The crucial point in it is to replace the value which the condition with a bigger index obtain with $\xi$, and in the present situation with $\xi, \eta)$, by the condition with a smaller index. This should be done carefully over a common part of this conditions. The item above insures that the relevant common part does not change once the condition with a bigger index is evaluated according to $\xi', \eta'$.

Let us describe an additional relevant situation. It may occur as well proving the chain condition once at one of the components say in $\lambda_0$ a non-direct extension was made.

Thus over $\kappa_n$ we may have the following two condition:

both consist of an initial segment corresponding (via the splitting) to $\lambda_0$ having last models $Z$ and $Z'$ correspondingly and models $M$ and $M'$ above for $\lambda_1$. $Z$ and $Z'$ are different and say $Z \in Z'$, the same with $M$ and $M'$ (i.e. $M \in M'$). Assume that they have a common part which is over $\kappa_n$ is unbounded in both $Z$ and $Z'$. Now a non-direct extension was made over $\lambda_0$, so we no way to put $Z$ and $Z'$ together. Still there is a need to combine two such conditions together without taking a non-direct extension over $\lambda_1$ or $\kappa_n$. The way of doing this will be as follows. We either move $Z'$ to $b'$ (of the extension of the second (')-condition) and replace it in $b$ by $Z$ together with $M$, where $M$ is added as already was described in the case of only direct extensions. Or, alternatively, we keep $Z'$ and add $Z$ with $M$ to $b'$.

(m) $\neg b'$ is a subset of $X \cup Y$ such that for each $\xi \in A_0, \eta \in A_1$ we have

i. $\text{dom}(b'\ddot{\cdots}\ddot{\cdots}[\xi, \eta]) \cap \neg b'\ddot{\cdots}[\xi, \eta] = \emptyset$,

ii. for any $\xi' \in A_0, \eta' \in A_1, \xi' > \xi, \eta' \geq \eta$ and $t \in \text{dom}(b'\ddot{\cdots}[\xi', \eta']) \setminus \text{dom}(b'\ddot{\cdots}[\xi, \eta])$ we require $t \in \neg b'\ddot{\cdots}[\xi, \eta]$.

The reason for introducing $\neg b'$ is to insure the Prikry condition of the forcing. Thus once running the standard argument for showing the Prikry condition we take (at each level) non direct extensions and then combine them together into a direct one. Without the above requirement it is possible to extend a given forcing condition non directly by picking some $\xi \in A_0, \eta \in A_1$ and then to extend further by adding to $\text{dom}(b'\ddot{\cdots}[\xi, \eta])$ some $t$ which belongs to $\text{dom}(b'\ddot{\cdots}[\xi', \eta'])$ for some $\xi' \in A_0, \eta' \in A_1, \xi' > \xi, \eta' \geq \eta$. Such addition may now contradict 9(l)iiiE.
(n) \( g \) is the usual one (i.e. as in all short extenders forcings), it is a function from \( \kappa^{+3} \) to \( \kappa_{n} \) of cardinality at most \( \kappa \).

\( Q_{n1} \) is defined in the usual fashion, only we have here more functions.

**Definition 4.6.2** \( Q_{n1} \) consists of sequences \( \langle (f_{m} \mid m \leq n), g \rangle \) such that

1. for every \( m \leq n \), \( f_{m} \) is a partial function from \( \kappa^{++} \) to \( \lambda_{m} \) of cardinality at most \( \kappa \),
2. \( g \) is a partial function from \( \kappa^{+3} \) to \( \kappa_{n} \) of cardinality at most \( \kappa \).

We have here intermediate non direct extensions between \( Q_{n0} \) and \( Q_{n1} \). Just it is possible to take a non direct extension at each of \( \lambda_{m} \)'s (\( m \leq n \)).

Turn now to the definition of the main forcing.

**Definition 4.6.3** The set \( P \) consists of all sequences \( p = \langle p_{n} \mid n < \omega \rangle \) so that

1. for every \( n < \omega \), \( p_{n} \in Q_{n} \)
2. there is \( \ell(p) < \omega \) such that

   (a) for every \( n < \ell(p) \), \( p_{n} \in Q_{n1} \)

   (b) for every \( n \geq \ell(p) \), \( p_{n} = \langle \langle a_{nm}, A_{nm}, f_{nm} \mid m \leq n \rangle, \langle b_{n}, b'_{n}, -b'_{n}, B_{n}, g_{n} \rangle \rangle \in Q_{n0} \)

   (c) for every \( n, n' \geq \ell(p), m \leq \min(n, n') \) max(dom(\( a_{nm} \))) = max(dom(\( a_{n'm'} \))) and max(dom(\( b_{n} \))) = max(dom(\( b_{n'} \)))

   (d) for every \( n \geq n' \geq \ell(p) \), for every \( m \leq n, m' \leq n' \), if \( m' \leq m \), then dom(\( a_{n'm'} \)) \subseteq dom(\( a_{nm} \))

   (e) for every \( n, m, \ell(p) \leq n < \omega, m \leq n \), and \( X \in \text{dom}(a_{nm}) \) the following holds: for each \( k < \omega \) the set

\[
\{(n', m') \in \omega^{2} \mid -(a_{n'm'}(X) \cap H(\chi^{+k}) \prec H(\chi^{+k}))\}
\]

is finite.

Turn now to \( b_{n} \)'s. Assume that \( n \geq \ell(p) \).

(f) For every \( A \in \text{dom}(b_{n}) \cup \text{dom}(b'_{n}) \) we require that the cardinality of \( b_{n+1}(A) \) (or of \( b'_{n+1}(A) \), if \( A \in \text{dom}(b'_{n}) \)) is above those of \( b_{n}(A) \) (or those of \( b'_{n}(A) \) respectively).
(g) If $\alpha$ is as above in (9l) at the level $n$, then the sequences (i.e. models, ordinals of their domains) of $b'_n$ for $\alpha$ are incorporated together (i.e. in order preserving fashion) inside $b\sim_{n+1}$ or alternatively inside $b'\sim_{n+1}$.

The rest of the requirements are similar to those of 4.4 with obvious adaptations.

Let us define the order $\leq^*$.

**Definition 4.6.4** Let $p = \langle p_n \mid n < \omega \rangle, q = \langle q_n \mid n < \omega \rangle \in \mathcal{P}$. Set $q \leq^* p$ iff

1. $\ell(q) = \ell(p),$

2. for every $n < \ell(p), q_n \leq_{Q_{n_1}} p_n,$

3. for every $n, \ell(p) \leq n < \omega$, the following holds:

$$q_n = \langle \langle a(q)_{nm}, A(q)_{nm}, f(q)_{nm} \rangle \mid m \leq n \rangle, \langle b(q)_n, b'(q)_n, B(q)_n, g(q)_n \rangle \rangle \leq_{Q_{n_0}}$$

$$p_n = \langle \langle a(p)_{nm}, A(p)_{nm}, f(p)_{nm} \rangle \mid m \leq n \rangle, \langle b(p)_n, b'(p)_n, B(p)_n, g(p)_n \rangle \rangle,$$

where $\leq_{Q_{n_0}}$ is defined in the usual fashion with two additions:

- the partition used in $q_n$ can be refined (we allow to combine intervals together).

Note that it does not case problems with the chain condition of the forcing since the number of elements used to define partitions is less than $\lambda_n$ and we would like to have $\kappa^{++}$-c.c.

- $b'(p)_n$ extends $b(q)_n$,

- $\neg b'(p)_n$ extends $\neg b(q)_n$

The orders $\leq$ and $\rightarrow$ on $\mathcal{P}$ are defined now as in 4.4.

Let us turn to the main issue- the chain condition.

**Lemma 4.6.5** The forcing $\langle \mathcal{P}, \rightarrow \rangle$ satisfies $\kappa^{++}$-c.c.

**Proof.** The proof mainly repeats the corresponding proof in 4.4. An additional point used in order to show the compatibility was explained in 4.6.1(9(l)iiiE).
Chapter 5
Gaps from optimal assumptions

Our aim here will be to present constructions in which the power of a singular cardinal may be arbitrary large starting from the weakest possible assumption:

$$\exists \kappa \forall n < \omega \exists \alpha < \kappa (\delta(\alpha) = \alpha + n).$$

5.1 $\aleph_1$–gap and infinitely many drops in cofinalities

5.1.1 Preliminary settings

Let $\kappa$ be a singular cardinal of cofinality $\omega$ such that for each $\gamma < \kappa$ and $n < \omega$ there is $\alpha, \gamma < \alpha < \kappa$, such that $\delta(\alpha) = \alpha + n$. We fix a sequence of cardinals $\kappa_0 < \kappa_1 < ... < \kappa_n < ..., n < \omega$ so that

- $\bigcup_{n<\omega} \kappa_n = \kappa$
- for every $n < \omega$, $\kappa_n$ is $\kappa_n^{+n+2}$-strong as witnessed by an extender $E_{\kappa_n}$
- for every $n < \omega$, the normal measure of $E_{\kappa_n}$ concentrates on $\tau$'s which are $\tau^{+n+2} + \omega_1$-strong as witnessed by a coherent sequence of extenders $\langle E_\tau(\xi)|\xi < \omega_1 \rangle$

Fix also an increasing sequence $\langle \lambda_n|n < \omega \rangle$ such that

- $\lambda_0 < \kappa_0$
- $\kappa_{n-1} < \lambda_n < \kappa_n$, for every $n, 0 < n < \omega$
- for every $n < \omega$, $\lambda_n$ is $\lambda_n^{+n+2}$-strong as witnessed by an extender $E_{\lambda_n}$
Our aim will be to make $2^\kappa = \kappa^{+\omega_1+1}$. There is nothing special here in choosing $\omega_1$. The same construction will work if we replace everywhere $\omega_1$ by an ordinal $\theta$, $\theta < \lambda_0$. Actually, replacing the original $\lambda_0$ by a bigger one, we can deal similar with any $\theta < \kappa$. Note that for finite $\theta$’s our assumption is not anymore optimal and for countable $\theta$’s the result was already known, see the detailed discussion in [5].

Force first with the preparation forcing $\mathcal{P}'(\kappa^{+\omega_1+1})$ of Chapter 2 with $\theta = \kappa^{+\omega_1+1}$. Then the main forcing will produce the following PCF. We assign to $\kappa^{++}$ at a level $n$ the indiscernible $\eta_n^{+n+2}$, where $\eta_n$ is the indiscernible for the normal measure of the extender $E_{\kappa_n}$. The correspondence between regular cardinals in the interval $[\kappa^{+3}, \kappa^{+\omega_1+1}]$ will be as follows: we assign to $\kappa^{+\omega_1+1}$ at a level $n$ the indiscernible $\rho_n^{+n+2}$, where $\rho_n$ is the indiscernible for the normal measure of the extender $E_{\kappa_n}$. Let $\langle \rho_{n \alpha} | \alpha < \omega_1 \rangle$ the Magidor sequence corresponding to the normal measures of $E_{\rho_n}$ the one used in the extender based Magidor forcing to change cofinality of $\rho_n$ to $\omega_1$. For every $\alpha, 1 < \alpha < \omega_1$, we assign $\rho_{n \alpha}^{+n+2}$ to $\kappa^{+\alpha+1}$.

The role of $\lambda_n$’s is to produce the first drop. It is possible to incorporate them into Magidor sequences as their first elements. It seems a bit more convenient to separate the first drop.

5.1.2 Projections

Let $p = \langle A^{0\tau}, A^{1\tau}, C^{\tau} \rangle \mid \tau \in [\kappa^+, \kappa^{+\omega_1+1}] \cap \text{Cardinals} \rangle \in \mathcal{P}'(\kappa^{+\omega_1+1})$. Suppose that $\eta$ is a regular cardinal in $[\kappa^+, \kappa^{+\omega_1+1}]$. We would like to define $p \upharpoonright \eta$ - the restriction of $p$ to $\eta$.

Thus if $A \in A^{1\tau}, \tau \in [\kappa^+, \eta] \cap \text{Cardinals}$, then set $A \upharpoonright \eta = A \cap H(\eta^+)$. Define

$$A^{1\tau} \upharpoonright \eta = \{ A \upharpoonright \eta \mid A \in A^{1\tau} \}, C^{\tau} \upharpoonright \eta = \{ A \upharpoonright \eta \mid A \in C^{\tau} \},$$

for every $\tau \in [\kappa^+, \eta] \cap \text{Cardinals}$ and

$$p \upharpoonright \eta = \langle A^{0\tau} \upharpoonright \eta, A^{1\tau} \upharpoonright \eta, C^{\tau} \upharpoonright \eta \rangle \mid \tau \in [\kappa^+, \eta] \cap \text{Cardinals}. $$

**Lemma 5.1.1** Suppose that $\eta$ is a regular cardinal in $[\kappa^+, \kappa^{+\omega_1+1}]$ and $p \in \mathcal{P}'(\kappa^{+\omega_1+1})$. Then $p \upharpoonright \eta \in \mathcal{P}'(\eta)$.

**Proof.** Let $p = \langle A^{0\tau}, A^{1\tau}, C^{\tau} \rangle \mid \tau \in [\kappa^+, \kappa^{+\omega_1+1}] \cap \text{Cardinals} \rangle$. Note that if $A, B \prec H(\kappa^{+\omega_1+2}), A, B \supseteq \kappa^+, |A|, |B| \leq \eta$ and $A \in B$, then $A \upharpoonright \eta \in B \upharpoonright \eta$. Thus, if $\eta = \kappa^{+\omega_1+1}$, then $A \upharpoonright \eta = A, B \upharpoonright \eta = B$. If $\eta < \kappa^{+\omega_1+1}$, then $H(\eta^+) \in B$, which implies $A \cap H(\eta^+) \in B$, but $|A| \leq \eta$, hence $A \cap H(\eta^+) \subseteq H(\eta^+)$. This implies that $C^{\tau} \upharpoonright \eta \mid \tau \in [\kappa^+, \eta] \cap \text{Cardinals} \rangle \in \mathcal{P}'(\eta)$, i.e. the restriction of central lines of $p$ satisfies the definition of central lines of $\mathcal{P}'(\eta)$, see Definition 2.2.1(Chapter 2).

118
The rest follows now by induction on complexity of pistes.

Note that if \( G \) is a generic subset of \( \mathcal{P}'(\kappa^{+\omega_1+1}) \), then \( G \upharpoonright \eta := \{ p \mid \eta \mid p \in G \} \) is never generic for \( \mathcal{P}'(\eta) \), since it is possible to extend an arbitrary condition \( q \in \mathcal{P}'(\eta) \) to one with a maximal model (say those of cardinality \( \kappa^+ \)) which is not of the form \( A \cap H(\eta^+) \) for any \( A < H(\kappa^{+\omega_1+2}) \).

It is possible under the same lines to deal with arbitrary regular \( \theta \) instead of \( \kappa^{+\omega_1+1} \). The following holds:

**Lemma 5.1.2** Let \( p = \langle \langle A^0, A^1, C \rangle \mid \tau \in s \rangle \in \mathcal{P}'(\theta) \) and \( \eta \in s \) is a regular cardinal. Then \( p \upharpoonright \eta \in \mathcal{P}'(\eta) \).

Define now restrictions of suitable structures.

Let \( \mathfrak{X} = \langle X, E, C, \in, \subseteq \rangle \) be a suitable structure, \( p(\mathfrak{X}) = \langle \langle A^0(\mathfrak{X}), A^1(\mathfrak{X}), C(\mathfrak{X}) \mid \tau \in s(\mathfrak{X}) \rangle \rangle \) the corresponding condition in \( \mathcal{P}'(\theta) \) (see Definition 2.4.6) and \( \eta \) a regular cardinal in \( s(\mathfrak{X}) \).

Set \( \mathfrak{X} \upharpoonright \eta \) to be the suitable structure generated by \( p(\mathfrak{X}) \upharpoonright \eta \).

### 5.2 Level \( n \)

Fix \( G(\mathcal{P}'(\kappa^{+\omega_1+1})) \) be a generic subset of \( \mathcal{P}'(\kappa^{+\omega_1+1}) \).

Let \( n < \omega \). We describe the forcing used at the level \( n \) of the construction.

**Definition 5.2.1** Let \( Q_{nb} \) be the set consisting of pairs of triples \( \langle \langle a, A, f \rangle, \langle b, B, g \rangle \rangle \) so that:

1. \( f \) is partial function from \( \kappa^{+2} \) to \( \lambda_n \) of cardinality at most \( \kappa \).

2. There is a suitable generic structure \( \mathfrak{X} = \langle X, E, C, \in, \subseteq \rangle \) with the corresponding condition \( p(\mathfrak{X}) = \langle \langle A^0(\mathfrak{X}), A^1(\mathfrak{X}), C(\mathfrak{X}) \mid \tau \in s(\mathfrak{X}) \rangle \rangle \) and \( |\bigcup_{\tau \in s(\mathfrak{X})} A^1(\mathfrak{X})| < \lambda_n \) (this is basically the total number of structures in \( \mathfrak{X} \)), such that
   \( a \) is an order preserving function from the set \( \{ Z \cap \kappa^{++} \mid Z \in C^\kappa(\mathfrak{X}) \} \) to \( \lambda_n^{+n+2} \).

3. \( a(X \cap \kappa^{++}) = \max(\text{rng}(a)) \) is above all the elements of \( \text{rng}(a) \) in the order of the extender \( E_{\lambda_n} \).

4. \( \text{dom}(a) \cap \text{dom}(f) = \emptyset \)

5. \( A \in E_{\lambda_n,a(\max(a))} \)
6. \( \min(A) > |\bigcup_{\tau \in s} A^{1^\tau}(X)|. \)

7. for every ordinals \( \alpha, \beta, \gamma \) which are elements of \( \text{rng}(a) \) or actually the ordinals coding models in \( \text{rng}(a) \) we have

\[
\alpha \geq_{E_{\lambda_n}} \beta \geq_{E_{\lambda_n}} \gamma \quad \text{implies} \\
\pi_{\lambda_n,\alpha,\gamma}(\rho) = \pi_{\lambda_n,\beta,\gamma}(\pi_{\lambda_n,\alpha,\beta}(\rho))
\]

for every \( \rho \in \pi''_{\lambda_n,\max(\text{rng}(a)),a}(A) \).

Let us turn now to the second component of a condition, i.e. to \( \langle b, B, g \rangle \).

8. \( g \) is a partial function from \( \kappa^{+\omega_1+1} \) to \( V_{\kappa_n} \) of cardinality at most \( \kappa \).

It will be further convenient to view it as a sequence of functions \( \langle g_\alpha \mid 1 < \alpha \leq \omega_1 \rangle \).

This function as usual is needed to hide the actual correspondence once a non-direct extension was made. Here, once a non-direct extension was used somewhere over \( \lambda_n \) or in the Extender Based Magidor forcing over \( \kappa_n \), we will make one which chooses \( \rho_{n\omega_1} \) (the \( \omega_1 \)-th, the largest element of the Magidor sequence for \( \kappa_n \)) and from this point \( g \) will be combined with \( \sim \) hiding the information.

9. \( B = \langle B_\alpha \mid 1 < \alpha \leq \omega_1 \rangle \) such that for every \( \alpha, 1 < \alpha \leq \omega_1 \), we have

\( a) \ B_\alpha \in E_{\kappa_n,\alpha,\zeta_\alpha} \), where \( \zeta_\alpha \) is large enough (in the order of the extender \( E_{\kappa_n,\alpha} \)) to include all the possibilities for \( \text{rng}(b_\alpha) \) which will be defined below.

Note that in Chapter 4 we used names sets of measure one instead. It is possible to do the same there and to work with actual sets just choosing large enough \( \zeta \)'s.

10. \( b = \langle b_\alpha \mid 1 < \alpha \leq \omega_1 \rangle \) is a name, depending on \( \langle a, A \rangle \), of a partial functions \( b_\alpha \) of cardinality less than \( \lambda_n \).

For each \( \alpha, 1 < \alpha \leq \omega_1 \), and \( \eta \in A \) the interpretation \( b_\alpha[\eta] \) of \( b_\alpha \) according to \( \eta \) satisfies the following conditions.

\( a) \) There is a suitable structure \( X_{\alpha,\eta} \) at the level \( \kappa_n \) (actually at the \( \alpha \)-th member \( \rho_{n\alpha} \) of the Magidor sequence for \( \kappa_n \)), such that

i. \( b_\alpha[\eta] \) is an isomorphism between \( X \upharpoonright \kappa^{+\alpha+1} \) and \( X_{\alpha,\eta} \),

ii. for every \( Z \in A^{1^\kappa^{+\alpha+1}}(X \upharpoonright \kappa^{+\alpha+1}) \) we have

\[
\pi_{\lambda_n,\max(\text{rng}(a)),a}(Z \cap \kappa^{++})(\eta) = b_\alpha[\eta](Z) \cap ((\eta)^0)^{+n+2}.
\]
In particular,

\[ \eta = \mathcal{B}_\alpha[\eta](A^{0\kappa^+}(\mathcal{X} \upharpoonright \kappa^{\alpha+1})) \cap ((\eta)^0 + n + 2). \]

iii. for every \( \tau, 1 < \tau \leq \alpha \) and \( Z \in A^{1\kappa^{\tau+1}}(\mathcal{X} \upharpoonright \kappa^{\alpha+1}) \) we have \( \mathcal{B}_\alpha[\eta](Z) \) a name of a structure of cardinality \( \rho_{\alpha^\tau}^{\kappa^+ n + 2} \) (where \( \rho_{\alpha^\tau} \) is the \( \tau \)-th element of the Magidor sequence) depending only on the the \( \tau \)-th member of the Magidor sequence for \( \kappa_n \) which is not yet determined.

If say we have some \( \beta, 1 \leq \beta \leq \tau \) and \( Y \in A^{1\kappa^{\beta+1}}(\mathcal{X} \upharpoonright \kappa^{\alpha+1}) \) and \( Z \in Y \), then the name \( \mathcal{B}_\alpha[\eta](Z) \) should belong to any interpretation of \( \mathcal{B}_\alpha[\eta](Y) \), according to the \( \beta \)-th member of the Magidor sequence, if \( \beta > 1 \) and \( \mathcal{B}_\alpha[\eta](Z) \in \mathcal{B}_\alpha[\eta](Y) \), if \( \beta = 1 \).

Note that, say with \( \beta = 1 \), the set of possible values of \( \rho_{\alpha^\tau} \) has cardinality \( \kappa_n \) which is much larger than the size of the model \( \mathcal{B}_\alpha[\eta](Y) \) (which is below \( \lambda_n \)). Only the name of the image of \( Z \) is inside \( \mathcal{B}_\alpha[\eta](Y) \), but by the elementarity also the Extender Based Magidor forcing is inside. So, after preforming the forcing the model \( \mathcal{B}_\alpha[\eta](Y) \) expends to one which includes the Magidor sequence and the interpretation of the image of \( Z \).

This way the following connection will be established:

\( \kappa^{++} \) to \( \eta_n^{++n+2} \), where \( \eta_n \) is an indiscernible (one element Prikry) for \( \lambda_n \); \( \kappa^{++} \) to \( \rho_{\alpha^\tau}^{\kappa^+ n + 2} \), for every \( \tau, 1 < \tau \leq \alpha \).

(b) (Dependence) Let \( Z \in A^{1\kappa^{\tau+1}} \) for some \( \tau, 1 < \tau \leq \alpha \). There are \( \beta_1 < \beta_2 < \ldots < \beta_k < \alpha \) such that

- \( \tau \in \{2, \beta_1, \ldots, \beta_k\} \).
- \( \mathcal{B}_\alpha(Z) \) depends on the values of \( a(Z \cap \kappa^{++}) \) over \( \lambda_n \) and \( \mathcal{B}_{\beta_i}(Z \upharpoonright \kappa^{\beta_i+1}), \)
  \( i = 1, \ldots, k \).
- If \( Z = A^{0\kappa^{\tau+1}}(\mathcal{X} \upharpoonright \kappa^{\alpha+1}) \), then \( \mathcal{B}_\alpha(Z) \) depends only on the values of \( a(Z \cap \kappa^{++}) \) in case \( \tau = 2 \) and on \( a(Z \cap \kappa^{++}), \mathcal{B}_\tau(Z \upharpoonright \kappa^{+++1}), \) if \( \tau > 2 \).

(c) (Inclusion condition for cardinality \( \kappa^{++} \)) Let \( \eta, \eta' \in A, \eta < \eta' \). Then

- \( \mathcal{B}_\alpha(A^{0\kappa^{++}}(\mathcal{X} \upharpoonright \kappa^{\alpha+1}))[\eta] \in \mathcal{B}_\alpha(A^{0\kappa^{++}}(\mathcal{X} \upharpoonright \kappa^{\alpha+1}))[\eta'], \)
- if \( Z \in C^{\kappa^{++}}(\mathcal{X} \upharpoonright \kappa^{\alpha+1}) \) and

\[ \pi_{\lambda_n, \max \text{rng}(a)(Z \cap \kappa^{++})} (\eta') > \eta, \]

then either

\[ \mathcal{B}_\alpha(A^{0\kappa^{++}}(\mathcal{X} \upharpoonright \kappa^{\alpha+1}))[\eta] \in \mathcal{B}(Z)[\eta', \nu_1, \ldots, \nu_m] \]

121
or the \( k \)-type realized by \( \hat{\mathfrak{b}}_\alpha(A^{0k++}(\mathfrak{X} \upharpoonright \kappa^{+\alpha+1}))[\eta]\cap H(\chi^{+k}) \) is in \( \hat{\mathfrak{b}}_\alpha(Z)[\eta', \nu_1, ..., \nu_m] \), where \( \nu_1, ..., \nu_m \) are the elements of the Magidor sequence on which \( Z \) depends and \( k < \omega \) is the least such that \( \hat{\mathfrak{b}}_\alpha(Z)[\eta', \nu_1, ..., \nu_m] \subseteq H(\chi^{+k+1}) \).
The same holds over any element of \( \hat{\mathfrak{b}}_\alpha(Z)[\eta', \nu_1, ..., \nu_m] \), i.e. \( \text{tp}_k(z, \hat{\mathfrak{b}}_\alpha(A^{0k++}(\mathfrak{X} \upharpoonright \kappa^{+\alpha+1}))[\eta] \cap H(\chi^{+k})) \in \hat{\mathfrak{b}}(Z)[\eta', \nu_1, ..., \nu_m] \), for any \( z \in \hat{\mathfrak{b}}_\alpha(Z)[\eta', \nu_1, ..., \nu_m] \).

We require in addition that this \( k > 2 \).
Let us allow the above also if \( \hat{\mathfrak{b}}_\alpha(Z)[\eta', \nu_1, ..., \nu_m] \subseteq H(\chi^{+\omega}) \). In this case we take \( k \) to be any natural number above 2 and require that once we go up to the higher levels then corresponding \( k \)'s increase (with \( n \)).

We cannot in general require only that
\[
\hat{\mathfrak{b}}_\alpha(A^{0k++}(\mathfrak{X} \upharpoonright \kappa^{+\alpha+1}))[\eta] \in \hat{\mathfrak{b}}_\alpha(Z)[\eta', \nu_1, ..., \nu_m]
\]
since the sequence \( C \) of a new generic suitable structure may go not through the old maximal model. But still having the type inside \( Z \) will suffice.

Note that given \( \eta' \in A \) the number of possibilities for \( \eta \in \eta' \cap A \) is bounded by \( (\eta^0)^{\omega+n+1} \), as \( \eta' < (\eta^0)^{\omega+n+2} \).

(d) (Inclusion condition for cardinalities above \( \kappa^+ \)) Let \( \tau, 1 < \tau \leq \alpha \) be an ordinal.
We formulate a condition similar to the one above, but for structures of size \( \kappa^{+\tau+1} \).

Let \( \eta, \eta' \in A, \eta < \eta', \rho, \rho' \in B_\tau, \rho < \rho' \). Then

- \( \hat{\mathfrak{b}}_\alpha(A^{0\kappa^{+\tau+1}}(\mathfrak{X} \upharpoonright \kappa^{+\alpha+1}))[\eta, \rho] \in \hat{\mathfrak{b}}_\alpha(A^{0\kappa^{+\tau+1}}(\mathfrak{X} \upharpoonright \kappa^{+\alpha+1}))[\eta', \rho'], \) we mean by this the interpretations according the values of a \( \tau \)-th member of the Magidor sequence (i.e. \( \rho = \rho_{n\tau} \) or \( \rho' = \rho_{n\tau} \)).
- \( \hat{\mathfrak{b}}_\alpha(A^{0\kappa^{+\tau+1}}(\mathfrak{X} \upharpoonright \kappa^{+\alpha+1}))[\eta, \rho] \in \hat{\mathfrak{b}}_\alpha(A^{0\kappa^{+\tau+1}}(\mathfrak{X} \upharpoonright \kappa^{+\alpha+1}))[\eta', \rho'], \)
- If \( Z \in C^{\kappa^{+\tau+1}}(\mathfrak{X} \upharpoonright \kappa^{+\alpha+1}) \) and
\[
\pi_{\lambda_\alpha, \max rng(b_r), b(Z | \kappa^{+\tau+1})} (\rho') > \rho,
\]

then either
\[
\hat{\mathfrak{b}}_\alpha(A^{0\kappa^{+\tau+1}}(\mathfrak{X} \upharpoonright \kappa^{+\alpha+1}))[\eta, \rho] \in \hat{\mathfrak{b}}(Z)[\eta, \rho', \nu_1, ..., \nu_m]
\]
or the \( k \)-type realized by \( \hat{\mathfrak{b}}_\alpha(A^{0\kappa^{+\tau+1}}(\mathfrak{X} \upharpoonright \kappa^{+\alpha+1}))[\eta, \rho] \cap H(\chi^{+k}) \) is in \( \hat{\mathfrak{b}}_\alpha(Z)[\eta, \rho', \nu_1, ..., \nu_m] \), where \( \nu_1, ..., \nu_m \) are the rest of elements of the Magidor sequence on which \( Z \)
depends and \( k < \omega \) is the least such that \( b_\alpha(Z)[\eta, \rho', \nu_1, ..., \nu_m] \subseteq H(\chi^{+ k + 1}) \).

The same holds over any element of \( b_\alpha(Z)[\eta, \rho', \nu_1, ..., \nu_m] \), i.e. \( \text{tp}_k(z, b_\alpha(A^{\kappa^{+ \alpha}}(X | \kappa^{+ \alpha + 1}))[\eta, \rho] \cap H(\chi^{+ k})) \in b_\alpha(Z)[\eta, \rho', \nu_1, ..., \nu_m] \), for any \( z \in b_\alpha(Z)[\eta, \rho', \nu_1, ..., \nu_m] \).

We require in addition that this \( k > 2 \).

Let us allow the above also if \( b_\alpha(Z)[\eta, \rho', \nu_1, ..., \nu_m] \subseteq H(\chi^{+ \omega}) \). In this case we take \( k \) to be any natural number above 2 and require that once we go up to the higher levels then corresponding \( k \)'s increase (with \( n \)).

- The previous item with \( \eta \) replaced in \( b_\alpha(Z) \) by \( \eta' \).

11. For each \( \alpha, 1 < \alpha \leq \omega_1 \), the following holds:

\[
\{ \tau < \kappa^{+ \alpha + 1} \mid \tau \in \text{dom}(b_\alpha) \} \cap \text{dom}(g) = \emptyset.
\]

12. For every \( \alpha, 1 < \alpha \leq \omega_1, \nu \in A, \xi_1 \in B_{\beta_1}, \xi_2 \in B_{\beta_2}, \xi_3 \in B_{\beta_3}, \) with \( \beta_1, \beta_2, \beta_3 < \alpha \), and every ordinals \( \mu, \rho, \eta \) which are elements of \( \text{rng}(b_\alpha)[\nu, \xi_1, \xi_2, \xi_3] \) or actually the ordinals coding models in \( \text{rng}(b_\alpha)[\nu, \xi_1, \xi_2, \xi_3] \) we have

\[
\mu \geq E_{\kappa_n, \alpha}, \rho \geq E_{\kappa_n, \alpha}, \eta \quad \text{implies} \quad 
\pi_{\kappa_n, \mu, \eta}(\delta) = \pi_{\kappa_n, \mu, \rho}(\pi_{\kappa_n, \mu, \rho}(\delta))
\]

for every \( \delta \in \pi_{\kappa_n, \max \text{rng}(b_\alpha)[\nu, \xi_1, \xi_2, \xi_3], \mu}(B_\alpha) \setminus \max(\xi_1, \xi_2, \xi_3) \).

We define now \( Q_{n_1} \) and \( \langle Q_{n_1}, \leq_n, \leq_n^* \rangle \) similar to the corresponding notions of Chapter 4. The only new point here is that the Extender Based Magidor forcing is used here instead of a trivial one element Prikry forcing in Chapter 4.

**Definition 5.2.2** Suppose that \( \langle \langle a, A, f \rangle, \langle b, B, g \rangle \rangle \) and \( \langle \langle a', A', f' \rangle, \langle b', B', g' \rangle \rangle \) are two elements of \( Q_{n0} \). Define

\[
\langle \langle a, A, f \rangle, \langle b, B, g \rangle \rangle \geq_{Q_{n0}} \langle \langle a', A', f' \rangle, \langle b', B', g' \rangle \rangle
\]

iff

1. \( f \supseteq f' \).
2. For each \( \alpha, 1 < \alpha \leq \omega_1 \),

\[ g_\alpha \supseteq g'_\alpha. \]
3. \( a \supseteq a' \).
4. $\pi''_{\lambda_n, \max(a), \max(a')} A \subseteq A'$.

5. For each $\alpha, 1 < \alpha \leq \omega_1$,

$$\vec{b}_\alpha \text{ extends } \vec{b}'_\alpha,$$

according to the appropriate projections of measure one sets. This means just that the empty condition of (one element Prikry forcing followed by Extender Based Magidor) forces the inclusion.

6. For each $\alpha, 1 < \alpha \leq \omega_1$, we have

$$\pi''_{\kappa_n, \alpha, \kappa_n, \alpha'} [B_\alpha] \subseteq B'_\alpha,$$

where $\zeta_{\kappa_n}, \zeta'_{\kappa_n}$ denote the measures of the extender $E_{\kappa_n, \alpha}$ to which $B_\alpha$ and $B'_\alpha$ belong.

**Definition 5.2.3** $Q_{n1}$ consists of pairs $\langle f, g, t \rangle$ such that

1. $f$ is a partial function from $\kappa^{++} \to \lambda_n$ of cardinality at most $\kappa$.

2. $t$ is a condition in the Extender Based Magidor forcing of the length $\omega_1$ over some $\rho(t), \lambda_n < \rho(t) < \kappa_n$.

3. $g = \{g_\alpha \mid 1 < \alpha \leq \omega_1\}$.

   For each $\alpha, 1 < \alpha \leq \omega_1$, the following holds: $g_\alpha$ is function from $\kappa^{+\alpha+1}$ of cardinality at most $\kappa$ such that for each $\xi \in \text{dom}(g_\alpha)$ we have either

   • $g_\alpha(\xi) = \langle \rho, \nu \rangle$, for some $\rho < \kappa_n$ and a name in the extender based Magidor forcing over $\rho$ corresponding to the $\alpha$-th member of the Magidor sequence.

   Again, $\nu$ can be viewed as void if this forcing is undefined or does not have $\mu$-th sequence.

   Note that we do not require that necessarily $\rho = \rho(t)$.

Define a partial order $\leq_1$ over $Q_{n1}$.

**Definition 5.2.4** Let $\langle f, g, t \rangle, \langle f', g', t' \rangle \in Q_{n1}$. Then $\langle f, g, t \rangle \leq_1 \langle f', g', t' \rangle$ iff

1. $f' \supseteq f$,

2. $g'_\alpha \supseteq g_\alpha$, for each $\alpha, 1 < \alpha \leq \omega_1$,

3. $t'$ extends $t$ in the Extender Based Magidor forcing.

124
Definition 5.2.5 Let $Q_n = Q_{n0} \cup Q_{n1}$. Define $\leq_n^* = \leq_{n0} \cup \leq_{n1}$.

Define now a natural projection to the first coordinate:

Definition 5.2.6 Let $p \in Q_n$. Set $(p)_0 = p$, if $p \in Q_{n1}$ and let $(p)_0 = \langle a, A, f \rangle$, if $p \in Q_{n0}$ is of the form $\langle \langle a, A, f \rangle, \langle b, B, g \rangle \rangle$.

Let $(Q_n)_0 = \{ (p)_0 | p \in Q_n \}$.

Definition 5.2.7 Let $p, q \in Q_n$. Then $p \leq_n q$ iff either

1. $p \leq_n^* q$

or

2. $p = \langle \langle a, A, f \rangle, \langle b, B, g \rangle \rangle \in Q_{n0}$, $q = \langle e, h, t \rangle \in Q_{n1}$ and the following hold:

   (a) $e \supseteq f$

   (b) $h = \langle h_\alpha | 1 < \alpha \leq \omega_1 \rangle$ and for each $\alpha, 1 < \alpha \leq \omega_1$ we have $h_\alpha \supseteq g_\alpha$

   (c) $t$ extends the Extender Based Magidor part of $p$, decides $\rho_{n\omega_1}$ and $\rho(t) = \rho_{n\omega_1}$

   (d) $\text{dom}(e) \supseteq \text{dom}(a)$

   (e) $e(\max(\text{dom}(a))) \in A$

   (f) for every $\beta \in \text{dom}(a)$, $e(\beta) = \pi_{\lambda_n, a(\max(\text{dom}(a)), a(\beta)}(e(\max(\text{dom}(a))))$

   (g) for every $\alpha, 1 < \alpha \leq \omega_1$ we have $\text{dom}(h_\alpha) \supseteq \text{dom}(h_\alpha) \cap A^{1^{\kappa^+\alpha+1}}(\kappa+\alpha+1)$

   (h) for every $\alpha, 1 < \alpha \leq \omega_1$ we require that

   - for every $\beta \in \text{dom}(h_\alpha) \cap A^{1^{\kappa^+\alpha+1}}(\kappa+\alpha+1)$

     $h_\alpha(\beta) = \langle \rho(t), \text{the interpretation of } h_\alpha(\beta) \rangle$ after $\rho(t) = \rho_{n\omega_1}$

     and probably other members of the Magidor sequence are determined in $t$.

Definition 5.2.8 The set $\mathcal{P}$ consists of all sequences $p = \langle p_n | n < \omega \rangle$ so that

1. for every $n < \omega$, $p_n \in Q_n$

2. there is $\ell(p) < \omega$ such that

   (a) for every $n < \ell(p)$, $p_n \in Q_{n1}$

   (b) for every $n \geq \ell(p)$, $p_n = \langle \langle a_n, A_n, f_n \rangle, \langle b_n, B_n, g_n \rangle \rangle \in Q_{n0}$
(c) for every \( n, m \geq \ell(p) \), \( \max(\text{dom}(a_n)) = \max(\text{dom}(a_m)) \) and \( \max(\text{dom}(b_n)) = \max(\text{dom}(b_m)) \)

(d) for every \( n \geq m \geq \ell(p) \), \( \text{dom}(a_m) \subseteq \text{dom}(a_n) \) and \( \text{dom}(b_m) \subseteq \text{dom}(b_n) \)

(e) for every \( n, \ell(p) \leq n < \omega \), and \( X \in \text{dom}(a_n) \) the following holds:

for each \( k < \omega \) the set

\[ \{ m < \omega \mid \neg(a_m(X) \cap H(\chi^+k) \prec H(\chi^+k)) \} \]

is finite.

(f) for every \( n, \ell(p) \leq n < \omega \), and \( X \in \text{dom}(b_n) \) the following holds:

for each \( k < \omega \) the set

\[ \{ m < \omega \mid \exists \vec{\nu} \exists \alpha, 1 < \alpha \leq \omega_1, \bar{b}_m[\vec{\nu}] \text{ is defined, and } \neg((\bar{b}_m(X)[\vec{\nu}] \cap H(\chi^+k) \prec H(\chi^+k))) \} \]

is finite.

We define the orders \( \leq, \leq^* \) as in the previous chapters.

**Definition 5.2.9** Let \( p = \langle p_n \mid n < \omega \rangle, q = \langle q_n \mid n < \omega \rangle \) be in \( \mathcal{P} \). Define

1. \( p \geq q \) iff for each \( n < \omega \), \( p_n \geq q_n \)
2. \( p \geq^* q \) iff for each \( n < \omega \), \( p_n \geq^* q_n \)

**Definition 5.2.10** Let \( p = \langle p_n \mid n < \omega \rangle \in \mathcal{P} \). Set \( (p)_0 = \langle (p_n)_0 \mid n < \omega \rangle \).

Define \( (\mathcal{P})_0 = \{ (p)_0 \mid p \in \mathcal{P} \} \).

Finally, the equivalence relation \( \leftrightarrow \) and the order \( \rightarrow \) are defined on \( (\mathcal{P})_0 \) exactly as it was done in Chapter 4. We extend \( \rightarrow \) to \( \mathcal{P} \) as follows:

**Definition 5.2.11** Let \( p = \langle p_n \mid n < \omega \rangle, q = \langle q_n \mid n < \omega \rangle \in \mathcal{P} \). Set \( q \rightarrow p \) iff

1. \( (q)_0 \rightarrow (p)_0 \)
2. \( \ell(p) = \ell(q) \)
3. for every \( n < \ell(p) \), \( p_n \) extends \( q_n \)
4. for every \( n \geq \ell(p) \), let \( p_n = \langle \langle a_n, A_n, f_n \rangle, \langle b_n, B_n, g_n \rangle \rangle \) and \( q_n = \langle \langle a'_n, A'_n, f'_n \rangle, \langle b'_n, B'_n, g'_n \rangle \rangle \).

Require the following:
(a) \( g_n \supseteq g'_n \)

(b) there is \( b''_n = (\sim_{na} | 1 < \alpha \leq \omega_1) \) such that for every \( \alpha, 1 < \alpha \leq \omega_1, \nu, \nu' \in A_n \) the following holds:

i. \( \text{dom}(b'_{na}) = \text{dom}(b''_{na}) \)

ii. \( \pi''_{na, \alpha} B_{na} \subseteq B'_{na} \),

where \( \zeta(B_{na}), \zeta(B'_{na}) \) the indexes of the measures of \( E_{na} \) to which \( B_{na} \) and \( B'_{na} \) belong.

iii. \( b_n[\nu] \) extends \( b''_n[\nu'] \) and for each \( \nu \) and its projection \( \nu' \) we have

\[
   b_n[\nu] \text{ extends } b''_n[\nu']
\]

iv. \( \text{rng}(b'_{na})[\nu'] \mapsto_k \text{rng}(b''_{na})[\nu'] \), where \( \nu' \), \( \nu \) are as above and \( k_n \) is the \( k_n \)'s member of a nondecreasing sequence converging to the infinity.

v. \( \text{rng}(b'_{na})[\nu'] \upharpoonright \kappa+n+1 = \text{rng}(b''_{na})[\nu'] \upharpoonright \kappa+n+1 \).

5.3 Basic Lemmas

In this section we study the properties of the forcing \( \langle P, \leq, \leq^* \rangle \) defined in the previous section.

Lemma 5.3.1 Let \( p = \langle p_k | k < \omega \rangle \in P, p_k = \langle a_k, A_k, f_k \rangle, \langle b_k, B_k, g_k \rangle \rangle \) for \( k \geq \ell(p) \) and \( X \) be a model appearing in an element of \( G(P'_{\kappa+\omega_1+1}) \). Suppose that

(a) \( X \notin \bigcup_{\ell(p) \leq k < \omega} \text{dom}(b_k) \cup \text{dom}(g_k) \)

(b) \( X \) is a successor model or if it is a limit one with \( \text{cof}(\text{otp}X) - 1 = \kappa \)

Then there is a direct extension \( q = \langle q_k | k < \omega, \rangle, q_k = \langle a'_k, A'_k, f'_k \rangle, \langle b'_k, B'_k, g_k \rangle \rangle \) for \( k \geq \ell(q) \), of \( p \) so that starting with some \( n \geq \ell(q) \) we have \( X \upharpoonright \kappa+n \in \text{dom}(a'_k) \) and

\[
   X \upharpoonright \kappa+n+1 \in \text{dom}(b'_{na}) \text{ for each } k \geq n, 1 < \alpha \leq \omega_1.
\]

The proof is similar to those of the corresponding lemma in Chapters 1, 2.

Next three lemmas transfer directly from Chapters 1, 2.

Lemma 5.3.2 Let \( n < \omega \). Then \( \langle Q_{n0}, \leq_0 \rangle \) does not add new sequences of ordinals of the length \( < \lambda_n \), i.e. it is \( (\lambda_n, \infty) \) - distributive.

Lemma 5.3.3 \( \langle P, \leq^* \rangle \) does not add new sequences of ordinals of the length \( < \kappa_0 \).
Lemma 5.3.4 $\langle P, \le^* \rangle$ satisfies the Prikry condition.

Let us turn now to the chain condition lemma. The proof will be similar to those of 4.4.5.

Lemma 5.3.5 $\langle P, \rightarrow \rangle$ satisfies $\kappa^{++}$-c.c.

Proof. Suppose otherwise. Work in $V$. Let $\langle p_\zeta \mid \zeta < \kappa^{++} \rangle$ be a name of an antichain of the length $\kappa^{++}$. Using the strategic closure of $P'$, we find an increasing sequence 

$$\langle \langle A^{0_r}_\tau, A^{1_r}_\tau, C^r_\tau \rangle \mid \tau \in \text{Reg} \cap [\kappa^+, \kappa^{+\omega_1+1}] \rangle \mid \zeta < \kappa^{++} \rangle$$

of elements of $P'(\kappa^{+\omega_1+1})$ and a sequence $\langle p_\zeta \mid \zeta < \kappa^{++} \rangle$ so that for every $\zeta < \kappa^{++}$ the following hold:

(a) $\langle \langle A^{0_r}_\tau, A^{1_r}_\tau, C^r_\tau \rangle \mid \tau \in \text{Reg} \cap [\kappa^+, \kappa^{+\omega_1+1}] \rangle \models p_\zeta \le \check{p}_\zeta$, 
(b) $\bigcup_{\beta < \zeta} A^{0_{\kappa^{++}}}_\beta = A^{0_{\kappa^{++}}}_\zeta$, if $\zeta$ is a limit ordinal and $\tau \in \text{Reg} \cap [\kappa^+, \kappa^{+\omega_1+1}]$, 
(c) $\tau > A^{0_{\kappa^{++}}}_{\zeta+1} \subseteq A^{0_{\kappa^{++}}}_{\zeta}$, 
(d) $A^{0_{\kappa^{++}}}_{\zeta+1}$ is a successor model, 
(e) $\langle \langle A^{0_{\kappa^{++}}}_\mu, A^{1_{\kappa^{++}}}_\mu, C^{r_\mu}_\mu \rangle \mid \mu < \zeta \rangle \in A^{0_{\kappa^{++}}}_{\zeta+1}$, for every $\tau \in [\kappa^+, \kappa^{+\omega_1+1}]$, 
(f) for every $\zeta \le \beta < \kappa^{++}, \tau \in [\kappa^+, \kappa^{+\omega_1+1}]$ we have 

$$C^r_\zeta(A^{0_{\kappa^{++}}}_\tau)$$ is an initial segment of $C^r_\beta(A^{0_{\kappa^{++}}}_\beta)$, 

(g) $p_\zeta = \langle p_\zeta^n \mid n < \omega \rangle$, 

(h) for every $n \ge l(p_\zeta)$

- $A^{0_{\kappa^{++}}}_\zeta \cap \kappa^{++}$ is the maximal ordinal of dom($a_\zeta^n$) and $A^{0_{\kappa^{++}}}_\zeta \cap \kappa^{++} \in \text{dom}(a_\zeta^n)$, 
- $A^{0_{\kappa^{++}}}_\zeta$ is the maximal model of dom($b_\zeta^n$) and $A^{0_{\kappa^{++}}}_\zeta \in \text{dom}(b_\zeta^n)$,

where $p_\zeta^n = \langle a_\zeta^n, A_\zeta^n, f_\zeta^n \rangle, \langle b_\zeta^n, B_\zeta^n, g_\zeta^n \rangle$.

Actually this condition is the reason for not requiring the equality in (a) above.
Let $p_{cn} = \langle \langle a_{\zeta n}, A_{\zeta n}, f_{\zeta n} \rangle, \langle b_{\zeta n}, B_{\zeta n}, g_{\zeta n} \rangle \rangle$ for every $\zeta < \kappa^+$ and $n \geq l(p_\zeta)$. Let $\zeta < \kappa^+$. Fix some

$$\langle\langle B_{\zeta+1}^0, B_{\zeta+1}^1, D_{\zeta+1}^r \rangle \mid \tau \in \text{Reg} \cap [\kappa^+, \kappa^{+\omega_1+1}] \rangle \leq p_{\zeta}^r \langle\langle A_{\zeta+1}^0, A_{\zeta+1}^1, C_{\zeta+1}^r \rangle \mid \tau \in \text{Reg} \cap [\kappa^+, \kappa^{+\omega_1+1}] \rangle$$

which witnesses a generic suitability of structure $\text{dom}(b_{\zeta n})$ for each $n, l(p_\zeta) \leq n < \omega$, as in Definition 5.2.1, i.e. $\langle\langle B_{\zeta+1}^0, B_{\zeta+1}^1, D_{\zeta+1}^r \rangle \mid \tau \in \text{Reg} \cap [\kappa^+, \kappa^{+\omega_1+1}] \rangle = p(\mathfrak{X})$, for some suitable generic structure $\mathfrak{X}$. Note that $B_{\zeta+1}^0 \equiv \langle A_{\zeta+1}^0 \rangle$ and even if it does, then $D_{\zeta+1}^r (B_{\zeta+1}^0)$ need not be an initial segment of $C_{\zeta+1}^r (A_{\zeta+1}^0)$. By the definition of the order $\leq p$, there are $m < \omega$ and $E_1, ..., E_m \in \bigcup_{\tau \in \text{Reg} \cap [\kappa^+, \kappa^{+\omega_1+1}]} A_{\zeta+1}^r$ such that

$$\text{swt}(\langle\langle A_{\zeta+1}^0, A_{\zeta+1}^1, C_{\zeta+1}^r \rangle \mid \tau \in \text{Reg} \cap [\kappa^+, \kappa^{+\omega_1+1}] \rangle, E_1, ..., E_m)$$

are as in the definition of the order of $\mathcal{P}'$ (Chapter 1.1.1.15, Chapter 2.2.2.6).

By Lemma 5.3.1 it is possible to add all $E_i (i = 1, ..., m)$ to $\text{dom}(b_{\zeta n})$, for a final segment of $n$’s. By adding and taking non-direct extension if necessary, we can assume that $E_i$’s are already in $\text{dom}(b_{\zeta n})$, for every $n \geq l(p_\zeta)$.

Now we can apply the opposite switch (i.e. the one starting with $E_m$, then $E_{m-1}$, ..., and finally $E_1$) to $\text{dom}(b_{\zeta n})$ (and the corresponding to it under $b_{\zeta n}$ to $\text{rng}(b_{\zeta n})$). Denote the result still by $b_{\zeta n}$.

Finally, $\langle\langle A_{\zeta+1}^0, A_{\zeta+1}^1, C_{\zeta+1}^r \rangle \mid \tau \in \text{Reg} \cap [\kappa^+, \kappa^{+\omega_1+1}] \rangle$ will witness a generic suitability of structure $\text{dom}(b_{\zeta n})$ for each $n, l(p_\zeta) \leq n < \omega$.

In particular, we have now that the central line of $\text{dom}(b_{\zeta n, \tau})$ is a part of $C_{\zeta+1}^r (A_{\zeta+1}^0)$ and $A_{\zeta}^0$ is on it, for every $n, l(p_\alpha) \leq n < \omega$.

Shrinking if necessary, we assume that for all $\zeta, \xi < \kappa^+$ the following holds:

1. $\ell = l(p_\zeta) = l(p_\xi),$
2. for every $n < \ell$, $p_\zeta$ and $p_\xi$ are compatible in $Q_{n1},$
3. for every $n, \ell \leq n < \omega$, $\langle \text{dom}(f_{\zeta n}) \mid \zeta < \kappa^{++} \rangle$ and $\langle \text{dom}(g_{\zeta n}) \mid \zeta < \kappa^{++} \rangle$ form a $\Delta$-system with the kernel contained in $A_{0^{0\kappa^+}}^0,$
4. for every $n, \omega > n \geq \ell$, $\text{rng}(a_{\zeta n}) = \text{rng}(a_{\xi n}),$
5. for every $n, \omega > n \geq \ell$, $A_{\zeta n} = A_{\xi n},$
6. for every $n, \omega > n \geq \ell$, $B_{\zeta n} = B_{\xi n},$
(7) for every $n, \omega > n \geq \ell, \eta \in A_\xi n$ and $\vec{\nu}$ from appropriate $B_\xi n$'s we have $\text{rng} b_\xi n[\eta, \vec{\nu}] = \text{rng} b_{\xi n}[\eta, \vec{\nu}]$.

Shrink now to the set $S$ consisting of all the ordinals below $\kappa^+$ of cofinality $\kappa^+$. Let $\zeta$ be in $S$. For each $n, \ell \leq n < \omega$, there will be $\beta(\zeta, n) < \zeta$ such that

$$\text{dom}(b_{\zeta n}) \cap A_\zeta^{0n} \subseteq A_{\beta(\zeta, n)}^{0n}.$$ 

Just recall that $\text{dom}(b_{\zeta n})$ is not actually a name and $|\text{dom}(b_{\zeta n})| < \lambda_n$. Shrink $S$ to a stationary subset $S^*$ so that for some $\zeta^* < \min S^*$ of cofinality $\kappa^+$ we will have $\beta(\zeta, n) < \zeta^*$, whenever $\zeta \in S^*, \ell \leq n < \omega$. Now, the cardinality of $A_\zeta^{0n}$ is $\kappa^+$. Hence, shrinking $S^*$ if necessary, we can assume that for each $\zeta, \xi \in S^*, \ell \leq n < \omega$

$$\text{dom}(b_{\zeta n}) \cap A_\zeta^{0n} = \text{dom}(b_{\zeta n}) \cap A_\xi^{0n}.$$ 

Let us add $A_\zeta^{0n}$ to each $p_\zeta$ with $\zeta \in S^*$.

By 5.3.1, we can add it without adding ordinals and the only other models that probably were added are the images of $A_\zeta^{0n}$ under $\Delta$-system type isomorphisms. Denote the result for simplicity by $p_\zeta$ as well.

Let now $\xi < \zeta$ be ordinals in $S^*$. We claim that $p_\xi$ and $p_\zeta$ are compatible in $\langle P, \rightarrow \rangle$.

First extend $p_\zeta$ by adding $A_\zeta^{0n}$. This will not add other additional models or ordinals except the images of $A_\zeta^{0n}$ under isomorphisms to $p_\zeta$, as was remarked above.

Let $p$ be the resulting extension. Denote $p_\xi$ by $q$. Assume that $\ell(q) = \ell(p)$. Otherwise just extend $q$ in an appropriate manner to achieve this. Let $n \geq \ell(p)$ and $p_n = \langle \langle a_n, A_n, f_n, b_n, B_n, g_n \rangle \rangle$. Let $q_n = \langle \langle a'_n, A'_n, f'_n, b'_n, B'_n, g'_n \rangle \rangle$. Without loss of generality we may assume that the ordinal $a_n(A_\zeta^{0n} \cap \kappa^+)$ is $k_n$-good with $k_n \geq 5$. Just increase $n$ if necessary.

Realize the $k_n-1$-type of $\text{rng}(a'_n)$ below $a_n(A_\zeta^{0n} \cap \kappa^+)$ over $a_n((A_\zeta^{0n} \cap \kappa^+) \cap \text{dom}(a_n))$, i.e. above the common part on $\kappa^+$. Denote the ordinal corresponding to $\max(\text{rng}(a'_n))$ in this realization by $\delta'$. Note that $a_n(A_\zeta^{0n} \cap \kappa^+)$ and $\delta'$ have the same projection to the common part $a_n((A_\zeta^{0n} \cap \kappa^+) \cap \text{dom}(a_n))$.

Fix now $\eta \in A_n$. Set $\eta' = \pi_{\lambda_n, \max(\text{rng}(a_n))}, \delta'(\eta)$.

Consider first $b_{\eta, 2}(A^{0n}_{\xi+2} \restriction \kappa^{+3})[\eta]$. Recall that $b_{\zeta, 2}$ depends only on the one element Prikry forcing over $\lambda_n$ and here only on a choice of an element from $A_n$.

Again we can assume that $b_{\eta, 2}(A^{0n}_{\xi+2} \restriction \kappa^{+3})[\eta]$ is an elementary submodel of $\mathfrak{A}_{n, k_n}$ with $k_n \geq 5$ (and $k_n$ does not depend on $\eta$). Now we have

$$\eta' = \pi_{\lambda_n, \max(\text{rng}(a_n)), \delta'}(\eta) < \eta \text{ and } A^{0n}_{\xi+2} \in C^{\kappa^+}(A^{0n}_{\xi+1}).$$

130
Hence, by Definition 5.2.1(10c,10d), the $k_n\!-\!1$-type realized by $\tilde{b}_{n,2}(A^{\kappa^+}_{\xi+1})[\eta']$ is in $\tilde{b}_{n,2}(A^{\kappa^+}_{\xi+1})[\eta]$, as well as the $k_n\!-\!1$-type realized by $\tilde{b}_{n,2}(A^{\kappa^+}_{\xi+1})[\eta']$ over $\tilde{b}''_{n,2}(A^{\kappa^+}_{\xi+1} \cap \text{dom}(\tilde{b}_{n,2}))[\eta]$, i.e. the common part of of the conditions. Realize the $k_n\!-\!1$-type of $\tilde{b}_{n,2}(A^{\kappa^+}_{\xi+1})[\eta]'$ over $\tilde{b}''_{n,2}(A^{\kappa^+}_{\xi+1} \cap \text{dom}(\tilde{b}_{n,2}))[\eta]$, i.e. $\tilde{b}_{n,2}$’s.

Next we deal with $\tilde{b}_{n,3}$ and use the compatibility of $a_n$’s and $\tilde{b}_{n,2}$’s. Continue by induction all the way to $\tilde{b}_{n,\omega_1}$. This eventually will produce a condition $p^*_n \geq p_n$ with $q_n \rightarrow p^*_n$ as in Chapter 1.

□

Force with $\langle P, \rightarrow \rangle$. Let $G(P)$ be a generic set. By the lemmas above no cardinals are collapsed. Let $\langle \nu_n \mid n < \omega \rangle$ denotes the diagonal Prikry sequence added for the normal measures of the extenders $\langle E_{\lambda_n} \mid n < \omega \rangle$ and $\langle \rho_{n\alpha} \mid 1 < \alpha \leq \omega_1 \rangle$, for each $n < \omega$, the Magidor sequence for the normal measures of $E_{\kappa^n}$. We can deduce now the following conclusion:

**Theorem 5.3.6** The following hold in $V[G(P)(\kappa^+)^* \ldots * P'(\kappa^{+\alpha+1})^* \ldots * P'(\kappa^{+\omega_1+1}))$, $G(P)$:

1. $\text{cof}(\prod_{n<\omega} \nu_n^{+n+2}/\text{finite}) = \kappa^{++}$
2. for each $\alpha, 1 < \alpha \leq \omega_1$,

\[
\text{cof}(\prod_{n<\omega} \rho_n^{+n+2}/\text{finite}) = \kappa^{+\alpha+1}
\]

The proof follows easily from the construction.
5.4 Arbitrary Gaps from weakest assumptions

In the present section we would like to combine ideas of Sections 5.5 and 5.1 in order to blow up the power of $\kappa$ to $\kappa^{+\theta+1}$ for arbitrary $\theta$. Start with a singular cardinal $\kappa$ of cofinality $\omega$ such that for each $\gamma < \kappa$ and $n < \omega$ there is $\alpha, \gamma < \alpha < \kappa$, such that $o(\alpha) = \alpha^{+n}$. The present assumption is optimal by [6] and it is clearly weaker than those used in Section 5.5 (for each $\gamma < \kappa$ and $\tau < \omega$ there is $\alpha, \gamma < \alpha < \kappa$, such that $o(\alpha) = \alpha^{+\tau}$) which is in turn optimal once GCH holds below $\kappa$, by [5].

We fix a sequence of cardinals $\kappa_0 < \kappa_1 < \ldots < \kappa_n < \ldots, n < \omega$ so that

- $\bigcup_{n<\omega} \kappa_n = \kappa$
- for every $0 < n < \omega$, $\kappa_n$ is $\kappa_n^{+n+2}$ - strong, as witnessed by an extender $E_{\kappa_n}$
- for every $n < \omega$, the normal measure of $E_{\kappa_n}$ concentrates on $\tau$’s which are $\tau^{+n+2} + \eta(\tau, n)$ - strong as witnessed by a coherent sequence of extenders $\langle E_\tau(\xi) \mid \xi < \eta(\tau, n) \rangle$ of $\tau^{+n+2}$-extenders, where $\eta(\tau, n)$ may be taken to be $\tau^{+n+3}$ an ordinal above $\tau^{+n+2}$ which is a repeat point (see C. Merimovich [17]).

Such a length insures, by [17], that $\tau$ will remain a measurable after the Extender Based Radin forcing with the sequence $\langle E_\tau(\xi) \mid \xi < \eta(\tau, n) \rangle$.

Fix also an increasing sequence $\langle \lambda_n \mid n < \omega \rangle$ such that

- $\lambda_0 < \kappa_0$
- $\kappa_{n-1} < \lambda_n < \kappa_n$, for every $n, 0 < n < \omega$
- for every $n < \omega$, $\lambda_n$ is $\lambda_n^{+n+2}$ - strong as witnessed by an extender $E_{\lambda_n}$

We proceed as in 5.2. Instead of the Extender Based Magidor forcing, the Extender Based Magidor-Radin forcing of [17] is used. This leaves plenty of Mahlo cardinals of the form $\rho_{n\alpha}$ below $\rho_{n\theta}$ (the elements of the generic Magidor-Radin sequence at level $n$). So for any regular cardinal $\mu \leq \theta$ there will be enough possibilities of a form $\rho_{n\alpha}^{+n+2}$ to connect with $\mu$ in a way similar to those of 5.2.
### 5.5 Arbitrary Gaps with GCH below

In this section we would like using arguments under similar lines to obtain an arbitrary gap starting with $\kappa$ such that for

$$\text{for every } \tau < \kappa \text{ exists } \alpha < \kappa \quad o(\alpha) = \alpha^+ \tau.$$ 

Assume that $\text{cof}(\kappa) = \omega$. Obviously, the least $\kappa$ as above must have the cofinality $\omega$. As usual we assume GCH in the ground model. Fix a regular cardinal $\theta > \kappa$. Our purpose will be to make $2^\kappa = \theta^+$ without adding any new bounded subsets to $\kappa$. In particular GCH will holds below $\kappa$ in the final model. Note that by [5] our initial assumption is the necessary one.

Force the preparation forcing $\mathcal{P}'(\theta)$ of Chapter 2.

Fix an increasing unbounded in $\kappa$ sequence of cardinals $\langle \kappa_n | n < \omega \rangle$ such that

- $\kappa_0$ is $\kappa_0^{+3}$-strong witnessed by an extender $E_0$
- $\kappa_n$ is $\kappa_n^{+\kappa_n+1}$-strong witnessed by an extender $E_n$, for each $n, 0 < n < \omega$.

We use $E_0 \upharpoonright \kappa_0^{+3}$ at the level 0. $\theta^+$ is attached to $\kappa_0^{+3}$. Let $\mu$ be a cardinal in the interval $[\kappa^+, \theta]$. In a typical condition models of size $\mu$ will be attached to those of size $\kappa_0^{++}$. In particular models of different sizes over $\kappa$ will be connected to models of the same size over $\kappa_0$. It would not be problematic, since a non-direct extension will be taken over $\kappa_0$. Next we will use indiscernibles created over $\kappa_0$ to rule the attachment to the level 1. Thus, given an indiscernible $\rho$ which corresponds to one of models (a model will be picked generically, leaving a bit of freedom this way) connected to those of cardinality $\mu$ over $\kappa$, we consider the cardinal $\kappa_1^{+\rho+2}$ and connect it with $\mu$ over the level 1. Let $\kappa_1^{+\kappa_0+2}$ correspond to $\theta^+$. The conditions of the level 1 are similar to those of Chapter 4 only $\lambda_1$ is replaced here by $\kappa_0$. In particular size of domain of $b_1$ is less than $\kappa_0$ and the cofinalities drop at this level below $\kappa_0$.

At the next level- level 2 we use the indiscernible $\rho_1$ for $\kappa_1^{+\rho_1+2}$ as the cardinality of models which correspond to those of cardinality $\mu$ at this level. $\mu$ as a cardinal will be connected with $\kappa_1^{+\rho_1+2}$. Again let $\theta^+$ correspond to $\kappa_2^{+\kappa_1^{+\kappa_0+2}+2}$. An indiscernible $\rho_2$ for a model of size $\rho_1$ will be used at the next level (level 3) to determine the cardinal $\kappa_3^{+\rho_2+2}$ which will correspond to $\mu$ there. The conditions of the level 2 are similar to those of Chapter 4 only $\lambda_2$ is replaced here by $\kappa_1$. In particular size of domain of $b_2$ is less than $\kappa_1$ and the cofinalities drop at this level below $\kappa_1$. Continue to further levels in the same fashion.

133
At the level 0 we use $E_0 \upharpoonright \kappa_0^{+3}$. Set $\eta_0$ to be $\kappa_0^{+3}$ and $\eta_1 = \kappa_1^{+\kappa_0^{+2}}$. We force with $E_1 \upharpoonright \eta_1$ over $\kappa_1$. The size of condition at this level will be below $\kappa_0$. Let $n > 1$. Set $\eta_n = \kappa_n^{+\eta_{n-1}^{+2}}$. We use $E_n \upharpoonright \eta_n$, over $\kappa_n$. The size of condition at this level will be below $\kappa_{n-1}$.

Let us explain the idea behind the above and the necessity of this kind of approach. At each level $n$, starting with level 1, we have two types of objects: cardinal above $\kappa_n$ and models of sizes below $\kappa_{n-1}$. The indiscernibles for such cardinals will rule sizes of models to be used at the next level. This is needed in order to guarantee a degree of completeness of the main forcing. The use of models of small cardinalities (and droppings in cofinalities that comes with it) is supposed to compensate the number of cardinals at level $n$ that we are allowed to use (which is smaller than $\kappa_n$). Thus, even if models $Z$ of size $\kappa_n$ were allowed, then all possible cardinals will be inside $Z$. Assuming that number of cardinals between $\kappa$ and $\theta$ is $\kappa^{++}$ or beyond, it is unclear what to do with models over $\kappa$ (say of size $\kappa^+$) which do not contain all the cardinals of the interval $[\kappa^+, \theta]$, since no $Z$ as above can correspond to such models.

One complication here (relatively to the constructions of Chapter 2 and those of the previous section with $2^\kappa = \kappa^{+\theta}$, for $\theta < \kappa$) is that we do not have $\lambda_n$’s which separate $\kappa_n$’s one from an other. Namely, once a non-direct extension was made over some $\lambda_n$, then the same was done over the corresponding $\kappa_n$, as well. But we cannot do this here, since once a non-direct extension over $\kappa_0$ was made -the same must be done over $\kappa_1$ and then over $\kappa_2$, etc.

Here we will allow to make a non-direct extension at $\kappa_n$ without making it at $\kappa_{n+1}$. In this setting not only $\text{rng}(b_{n+1})$ will be a name, but also $\text{dom}(b_{n+1})$. This change is required now in order to show the Prikry condition. Thus, after picking a non-direct extension at a level $\kappa_n$, we need be able to keep a possible extension at the level $\kappa_{n+1}$. The number of models allowed at this level is below $\kappa_n$. So, we need to deal with such names, in order to accumulate together all the extensions at the level $n + 1$ according to all possible non-direct extensions at the level $n$.

Still we keep the maximal model explicit and not in a form of a name.

We need to make one change relatively to previous constructions with dropping cofinalities. Thus, during the standard argument for showing the Prikry condition, say we go through all the possibilities (non-directly) over a level $n$. Now, over the next level $n + 1$, it may be need to add new models (direct extensions here) in order to decide a given statement. But we do not have a control now over projection of such models to the level $n$. In previous setting - once a non-direct extension was made over $\lambda_n$ then such an extension was made
over \( \kappa_n \) as well and there was no further connection to \( \lambda_{n+1}, \kappa_{n+1} \). So here we may get types of models that do not appear inside other relevant models (remember that sizes of models used are small, and so not every type is inside). As a consequence of this the chain condition argument stops to work.

Let us suggest a way that allows to overcome this difficulty. It is possible to use it in the previous construction with dropping cofinalities as well.

Let \( M \) be an elementary submodel of \( \langle H(\chi^{+\omega}, <, ...) \rangle \) (for \( \chi \) regular large enough which contains all relevant information) of size \( \kappa_n \) and which is a union of an elementary chain \( \langle M_\alpha \mid \alpha < \kappa_n \rangle \) such that for every \( \alpha < \kappa_n \)

1. \( |M_\alpha| < \kappa_n \),
2. \( \langle M_\beta \mid \beta \leq \alpha \rangle \in M_{\alpha+1} \).

Now, as images of models of cardinality \( \kappa^+ \) let us use only models \( M_\alpha, \alpha < \kappa_n \), and models which realize similar types to the types of models of this sequence. Images of models of bigger size will be models which are elements of models of the sequence or of models which realize similar types to the types of models of the sequence. As before a choice of \( \eta \) in a set of measure one for a maximal coordinate over \( \kappa_n \) will determine the interpretation of \( b_{\kappa_{n+1}} \), i.e. \( b_{\kappa_{n+1}}[\eta] \) which a real function and not a name. Once \( \eta < \eta' \), let us require that also an index \( \alpha(\eta) \) which corresponds to the maximal model over \( \kappa_{n+1} \) according to \( \eta \) is less than \( \alpha(\eta') \).

Note that this restriction to the sequence \( \langle M_\alpha \mid \alpha < \kappa_n \rangle \) and similar types is not actually very strict. Namely, the following holds:

**Lemma 5.5.1** Let \( \alpha < \kappa_n \). Then

\[
M_\alpha \models \forall k < \omega \forall x \exists y (x \in y \land (\forall \delta < \chi \exists y' (\sup(y' \cap \chi) > \delta \land tp_k(y') = tp_k(y)))).
\]

**Proof.** Suppose otherwise. Then

\[
M_\alpha \models \exists k < \omega \exists x \forall y (x \in y \rightarrow (\exists \delta < \chi \neg \exists y' (\sup(y' \cap \chi) > \delta \land tp_k(y') = tp_k(y)))).
\]

Pick \( k < \omega \) and \( x \in M_\alpha \) witnessing this. By elementarity then

\[
H(\chi^{+\omega}) \models \forall y (x \in y \rightarrow (\exists \delta < \chi \neg \exists y' (\sup(y' \cap \chi) > \delta \land tp_k(y') = tp_k(y)))).
\]

Consider the set

\[
Z := \{tp_k(a) \mid x \in a\}
\]

135
of all \( k \)-types over \( x \). The size of \( Z \) is bounded below \( \chi \). This means that the same type should appear \( \chi \)-many times. Which is impossible. Contradiction.

\[ \Box \]

In particular, the following holds:

**Lemma 5.5.2** For each \( k < \omega \) and \( x \in \mathcal{M}_\alpha \) the \( k \)-type of \( \mathcal{M}_\alpha \cap H(\chi^k) \) over \( x \) appears unboundedly often below \( \chi \).

**Proof.** Let \( k, 0 < k < \omega \) and \( x \in \mathcal{M}_\alpha \). Pick \( y \in \mathcal{M}_\alpha \) as in the previous lemma. Then

\[ H(\chi^\omega) \models \forall \delta < \chi \exists y' (\sup(y' \cap \chi) > \delta \land tp_k(y') = tp_k(y)). \]

Fix \( \delta < \chi \). Find \( y' \) with \( \sup(y' \cap \chi) > \delta \) which realizes the same \( k \)-type as \( y \) over \( x \). Let \( t \) be the \( k-1 \)-type realized by \( \mathcal{M}_\alpha \) over \( y \). Then there will be \( t' \) which realizes the same \( k-1 \)-type over \( y' \). Hence \( t' \) will realize the same \( k-1 \)-type as those of \( \mathcal{M}_\alpha \).

\[ \Box \]

Note that on the other hand not every measure of the extender \( E_{n+1} \) is in \( \mathcal{M}_\alpha \), since its cardinality is just too small.

The next point will be to show \( \kappa^{++} \)-c.c. of the final forcing. The argument mostly repeats the corresponding one of Chapter 4. The only new element here will be the starting level for compatibility of two conditions, i.e. the one above which the extension will be a direct extension.

Thus, suppose we have two conditions \( p = \langle p_n \mid n < \omega \rangle \) and \( q = \langle q_n \mid n < \omega \rangle \) of the same length. For simplicity let \( \ell(p) = \ell(q) = 1 \). Also suppose that the ranges at each \( n > 0 \) are the same and the domains form a \( \Delta \)-system as in 5.3.5. Let \( \eta < \xi \) and \( A^0_{\eta^+}, A^0_{\xi^+} \) etc. be as in the proof of 5.3.5. We find a model \( X \) (not necessary in \( A^0_{\kappa^+} \)) which realizes the same type (more precisely, by one less) over \( \text{rng}(b^\xi_{\eta} \upharpoonright A^0_{\eta^+}) = \text{rng}(b^\xi_{\eta} \upharpoonright A^0_{\xi^+}) \) as \( b^\xi_{\eta}(A^0_{\eta^+}) \) does but has a smaller supremum. Note that \( \ell(p) = 1 \), so at the level 0 we have a non-direct extension of say the weakest condition. Hence, at the level 1, the real models and not the names are used (i.e. the interpretations of the names according the generic object at the level 0). It is possible to insure the existence of such model \( X \) as follows:

we just can assume without loss of generality that \( \sup(b^\xi_{\eta}(A^0_{\eta^+})) \) is an elementary submodel \( M \) of cardinality \( k^\xi_{\eta+1} \) of some \( H(\chi^{k+1}) \) with \( k > 5 \) or so. Then the \( k \)-type of \( b^\xi_{\eta}(A^0_{\eta^+}) \) over \( \text{rng}(b^\xi_{\eta} \upharpoonright A^0_{\xi^+}) \) is in \( M \). Using elementarity, it is easy to argue that there will be unboundedly many in \( \text{sup}(M) \) models realizing this type over \( \text{rng}(b^\xi_{\eta} \upharpoonright A^0_{\xi^+}) \). Then pick \( X \) to be one of them.
Now the measure of the extender $E_1$ corresponding to $X$ will be the same as those for $b_1^\xi(A_\xi^{0\kappa^+})$. Let $B_1$ be the set of measure one for this measure in the conditions (note that it is the same set in both. We increase the maximal coordinate in order to catch $X$ in the new maximal coordinate. Let $C_1$ be a set of measure one for this coordinate with corresponding projections to $b_1^\xi(A_\xi^{0\kappa^+})$ and to $X$ inside $B_1$. Pick some $\nu \in C_1$. Let $\nu'$ and $\nu''$ be its projections to $b_1^\xi(A_\xi^{0\kappa^+})$ and to $X$ respectively. Then $\nu'' < \nu'$, but further projections to the common part are the same, since it is inside both $b_1^\xi(A_\xi^{0\kappa^+})$ and $b_1^\eta(A_\eta^{0\kappa^+})$.

The model $X$ serves as $b_1^\eta(A_\eta^{0\kappa^+})$ on the $\xi$'s side. So we replace $b_1^\eta(A_\eta^{0\kappa^+})$ by an equivalent model. It is likely impossible to put things together at the level 1 in a direct extension fashion due to a quite arbitrary place of $X$ relatively to $b_1^\xi(A_\xi^{0\kappa^+})$. But there is no need here to make a direct extension. So we will take a non-direct.

It may be (and typically would be once $\theta$ is much larger than $\kappa$) that $A_\eta^{0\kappa^+}$ and $A_\xi^{0\kappa^+}$ have inside models of different cardinalities which are in domains of $b_1^\xi, b_1^\eta$. The images of such models should be of different cardinalities as well (at least starting from some level). The number of available cardinals over $\kappa_1$ is $\kappa_1^{+R_{+3}+3}$. The size of $X$ (as those of $b_1^\xi(A_\xi^{0\kappa^+})$) is only $\rho_0^+$. Hence most of cardinals are outside.

The choice of $X$ insures that at the next level (level 2) and up cardinalities will be different from those that appear in $b_1^\xi(A_\xi^{0\kappa^+}) \setminus X$.

There may be a need to apply a similar procedure at level 2, since the cardinals from level 1 corresponding to those over $\kappa$ are determined at level 0 (remember that we assumed $\ell(p) = 1$). It is possible that same cardinal over level 1 corresponds to different cardinals over $\kappa$. So we need to split between them at level 2, as it was done above.

Finally, given such $\nu'$ and $\nu''$ we go to the next level (level 2) and put together the conditions at this level in the usual fashion, as it was done in Chapter 4 and in Lemma 5.3.5. No further non-direct extension (beyond level 2) is needed here anymore.

### 5.6 Down to the first fixed point of the $\aleph$–function

It is possible to incorporate collapse in the construction of Section 5.5 in a fashion of [4] and to turn $\kappa$ into the first fixed point of the $\aleph$–function. Basically what is needed is to collapse all unused cardinals.

Set $\eta_0$ to be $\kappa_0^{+3}$ and $\eta_1 = \kappa_1^{+\kappa_0+2}$. For $n > 1$ set $\eta_n = \kappa_n^{+\eta_{n-1}+2}$.

Denote by $\rho_n$ the indiscernible for the normal measure of $E_n$. Then the indiscernible which corresponds to $\theta^+$ on level $n$ will be $\rho_n^{+\eta_{n-1}+2}$, if $n > 1$, $\rho_0^{+3}$, if $n = 0$ and $\rho_1^{+\kappa_0+2}$ if $n = 1$. 137
Now the relevant collapses will turn $\rho_0$ into $\aleph_1$, will preserve $\rho_0^+, \rho_0^{+3}, \rho_0^{+4}$. Then $\kappa_0$ will be turned into the immediate successor of $\rho_0^{+4}$, all the cardinals $\kappa_0^+, \kappa_0^{+3}, \kappa_0^{+4}$ will be preserved. Next, $\rho_1$ will be turned into the immediate successor of $\kappa_0^{+4}$, the cardinals in the interval $[\rho_1, \kappa_0^{+4}]$ will be preserved. Then $\kappa_1$ will become the immediate successor of $\rho_1^{+\kappa_0+3}$ and all the cardinals in the interval $[\kappa_1, \eta_1^+]$ will be preserved. $\rho_2$ will be turned into the immediate successor of $\eta_1^+$, all the cardinals of the interval $[\rho_2, \eta_1^{+n+3}]$ will be preserved, and so on.

Let us turn now to a modification of the construction of Section 5.4 which will allow to finish with the least fixed point of the $\aleph$-function. Note that here we will lose GCH below $\kappa$ (and even SCH will break down below). We would like to blow up the power of $\kappa$ to $\kappa^{+\theta+1}$ for arbitrary $\theta$ starting with a singular cardinal $\kappa$ of cofinality $\omega$ such that for each $\gamma < \kappa$ and $n < \omega$ there is $\alpha, \gamma < \alpha < \kappa$, such that $o(\alpha) = \alpha^{+n}$. In contrast to Section 5.4, we do not intend to create too long Magidor or Radin sequences, since having too many indiscernibles will prevent collapses needed in order to turn $\kappa$ into the first fixed point.

The present assumption is optimal by [6] and it is clearly weaker than those used in Section 5.5(for each $\gamma < \kappa$ and $\tau < \omega$ there is $\alpha, \gamma < \alpha < \kappa$, such that $o(\alpha) = \alpha^{+\tau}$) which is in turn optimal once GCH holds below $\kappa$, by [5].

We fix a sequence of cardinals $\kappa_0 < \kappa_1 < ... < \kappa_n < ...$, $n < \omega$ so that

- $\bigcup_{n<\omega} \kappa_n = \kappa$
- for every $0 < n < \omega$, $\kappa_n$ is $\kappa_n^{+n+2}$ - strong, as witnessed by an extender $E_{\kappa_n}$
- for every $n < \omega$, the normal measure of $E_{\kappa_n}$ concentrates on $\tau$’s which are $\tau^{+n+2} + \eta(\tau, n)$ - strong as witnessed by a coherent sequence of extenders $(E_{\tau}(\xi) \mid \xi < \eta(\tau, n))$ of $\tau^{+n+2}$-extenders, where $\eta(\tau, n)$ is $\kappa_{n-1}$, if $n > 0$ and $\eta(\tau, n) = 1$, if $n = 0$.

The idea behind is like this: once an indiscernible $\rho_n$ for the normal measure of the extender $E_{\kappa_n}$ was picked, then we use the coherent sequence $(E_{\rho_n}(\xi) \mid \xi < \eta(\tau, n))$ in order to change its cofinality to $\eta(\tau, n)$ using the Magidor Extender Based forcing (blowing its power to $\rho_n^{+n+2}$, as well). We have here $\kappa_{n-1}$ (say $n > 0$) cardinals available along the Magidor sequence.

Now we use the method of Section 5.5. Just instead of $\kappa_{n-1}$ over the level $n$ placed “horizontally” there, we have them placed “vertically” here.
Finally, since a relatively small number of indiscernibles are generated in the process, it is possible to define collapses as in the beginning of the section and turn $\kappa$ into the first repeat point of the $\aleph$–function. Note that SCH will break at each $\rho_n$, $0 < n < \omega$. 
Chapter 6

Two Stationary Sets with Different Gaps of the Power Function

Starting with a strong cardinal a model with a cardinal $\kappa$ of cofinality $\aleph_1$ such that both sets
\[ \{ \alpha < \kappa \mid 2^\alpha = \alpha^+ \} \]
and
\[ \{ \alpha < \kappa \mid 2^\alpha = \alpha^{+++} \} \]
are stationary is constructed. Based on this construction and using supercompacts a model in which both sets
\[ \{ \alpha < \kappa \mid 2^\alpha = \alpha^+ \} \]
and
\[ \{ \alpha < \kappa \mid 2^\alpha = \alpha^{+++} \} \]
are stationary is obtained.

6.1 Introduction

The classical theorem of Silver states that if $\kappa$ is a singular cardinal of uncountable cofinality and $2^\kappa > \kappa^+$, then the set
\[ \{ \alpha < \kappa \mid 2^\alpha > \alpha^+ \} \]
contains a club. But what if $2^\kappa = \kappa^+$, can both sets
\[ \{ \alpha < \kappa \mid 2^\alpha = \alpha^+ \} \]
and
\[ \{ \alpha < \kappa \mid 2^\alpha > \alpha^+ \} \]
be stationary?

The purpose of the present paper is to provide an affirmative answer. The construction uses supercompact cardinals. By [7], at least Woodin cardinals are necessary.

The main issue will be to construct a model with a cardinal $\kappa$ of cofinality $\aleph_1$ such that both sets
\[ \{ \alpha < \kappa \mid 2^\alpha = \alpha^+ \} \]
and
\[ \{ \alpha < \kappa \mid 2^\alpha = \alpha^{+++} \} \]
are stationary. We start from a regular cardinal $\kappa$ having a coherent sequence of $\kappa^{+\omega+3}$ extenders of the length $\aleph_1$. A variation of the extender based Magidor forcing (see [16], [18]) is used to change its cofinality to $\aleph_1$ blowing up powers of cardinals over the generic Magidor sequence below. The point will be to arrange a different behaviour on stationary sets. For this a special short extenders
forcing. Finally, for a model with \( \{ \alpha < \kappa \mid 2^\alpha = \alpha^+ \} \) and \( \{ \alpha < \kappa \mid 2^\alpha = \alpha^{++} \} \) both stationary, we plug in supercompacts cardinals into the previous construction and use them to collapse \( \alpha^+ \) to \( \alpha \) by changing its cofinality to \( \omega \), with \( \alpha \)'s in the generic Magidor sequence for \( \kappa \).

6.2 Preliminary Settings

6.2.1 Cofinal sequences and stationary set

Let us attach to every \( \delta, 0 < \delta < \omega_1 \), a successor ordinal \( \delta^* < \delta \) so that for every successor ordinal \( \tau < \omega_1 \) the set of \( \delta \)'s with \( \tau = \delta^* \) is stationary. Clearly, the set

\[
C = \{ \mu < \omega_1 \mid \mu \text{ is limit ordinal and for every successor } \tau < \mu \\
\text{the set of } \delta \text{'s below } \mu \text{ with } \delta^* = \tau \text{ is unbounded in } \mu \}
\]

is closed unbounded.

Let \( S \) be a subset of \( \lim(\lim(C)) \). It can be nonstationary, but in the interesting cases \( S \) will be stationary, costationary. For every \( \mu \in C \) fix a cofinal sequence \( \langle \mu'_n | n < \omega \rangle \). Let \( \mu \in C \). We define another cofinal sequence \( \langle \mu_n | n < \omega \rangle \) as follows:

\[
\mu_0 = 0, \quad \mu_{n+1} = \min \{ \delta < \mu \mid \delta \text{ limit, } \delta \not\in S, \delta^* = \mu_n \text{ and } \delta \geq \mu'_n + 1 \}.
\]

The advantage of using such improved cofinal sequences is that once we have \( \mu_n \) then \( \langle \mu_k | k \leq n \rangle \) is uniquely determined without need in \( \mu \). Thus \( \mu_{n-1} = (\mu_n - 1)^*, \mu_{n-2} = (\mu_{n-1} - 1)^* \), etc.

6.2.2 The extenders sequence

We assume that the ground model satisfies GCH and has a coherent sequence

\[
\vec{E} = \langle E(\alpha, \beta) \mid \alpha \leq \kappa, \alpha \in \text{dom } \vec{E}, \beta < \omega_1 \rangle
\]

such that for every \( \alpha \leq \kappa \) and \( \beta < \omega_1 \) the following hold:

(a) \( E(\alpha, \beta) \) is an \( (\alpha, \alpha^{+3}) \)-extender over \( \alpha \).

(b) (coherence)

\[
j_{E(\alpha, \beta)}(\vec{E}) \upharpoonright (\alpha + 1) = \langle E(\alpha', \beta') \mid (\alpha' < \alpha) \text{ or } (\alpha' = \alpha \text{ and } \beta' < \beta) \rangle,
\]

where \( j_{E(\alpha, \beta)} : V \to M \simeq \text{Ult}(V, E(\alpha, \beta)) \) is the elementary embedding by \( E(\alpha, \beta) \).
(c) there are disjoint subsets $\langle E_{\alpha,i} \mid i < \omega_1 \rangle$ of $\alpha$ such that $E_{\alpha,\beta}$ belongs to the normal measure $E(\alpha,\beta)(\alpha)$ of $E(\alpha,\beta)$ and for every $\gamma \leq \alpha, \gamma \in \text{dom } \vec{E}, i < \omega_1$

$$E_{\alpha,i} \cap \gamma = E_{\gamma,i},$$

where for $\tau < \alpha^{+\omega+3}$ the $\tau$-th measure $E(\alpha,\beta)(\tau)$ of $E(\alpha,\beta)$ is the set $\{X \subseteq \alpha \mid \tau \in j_{E(\alpha,\beta)}(X)\}$.

(d) $\vec{E} \upharpoonright (\alpha, \beta) = j_{E(\alpha,\beta)}(f)(\alpha)$ for some $f \in {}^\alpha V_\alpha$, i.e., essentially it depends on the normal measure $E(\alpha,\beta)(\alpha)$, where

$$\vec{E} \upharpoonright (\alpha, \beta) = \langle \vec{E}(\alpha',\beta') \mid (\alpha' < \alpha) \text{ or } (\alpha' = \alpha \text{ and } \beta' < \beta) \rangle.$$

### 6.2.3 Types

Previously Short Extenders forcings were used in context of a singular cardinal $\kappa$ which is a limit of cardinals $\kappa_n$’s carrying extenders and types were defined over $\kappa_n$’s (say $\kappa_n^{+k_n+2}$ with sequences $\langle k_n \mid n < \omega \rangle$ converging to infinity). Here $\kappa$ is a regular cardinal, but we will work around $\kappa^{+\omega}$ and will use $\kappa^{+n}, n < \omega$ as a replacement.

Let $\chi$ be a regular cardinal large enough (thus $\kappa^{+\omega+4}$ will do it). For $k \leq \omega$ we consider a structure

$$\mathfrak{A}_k = \langle H(\chi^+), \in, \vec{E}, \rangle,$$

the enumeration of $[\kappa^{+\omega+3}]^{\leq \kappa}$, and of $[\kappa^{+\omega+2}]^{\leq \kappa}$,

$$\langle \chi^+ \mid n \leq k\rangle; \kappa, 0, 1, \ldots, \alpha \ldots \mid \alpha < \kappa^+ \rangle$$

in an appropriate language which we denote $\mathcal{L}_k$.

For an ordinal $\xi < \chi$ (usually $\xi$ will be below $\kappa^{+\omega+3}$) we denote by $tp_k(\xi)$ the $\mathcal{L}_k$-type realized by $\xi$ in $\mathfrak{A}_k$.

Let $\mathcal{L}'_k$ be the language obtained from $\mathcal{L}_k$ by adding a new constant $c'$. For $\delta < \chi$ let $\mathfrak{a}_{k,\delta}$ be the $\mathcal{L}'_k$-structure obtained from $\mathfrak{a}_k$ by interpreting $c'$ as $\delta$. The type $tp_k(\delta, \xi)$ is the $\mathcal{L}'_k$-type realized by $\xi$ in $\mathfrak{A}_{k,\delta}$. Further, we shall identify types with ordinals corresponding to them in some fixed well ordering of $\mathcal{P}(\kappa^+)$.

**Definition 6.2.1** Let $k \leq \omega$ and $\beta < \kappa^{+\omega+3}$ (or $\beta < \kappa^{+\omega+2}$). $\beta$ is called $k$-good iff

1. for every $\gamma < \beta$ $tp_k(\gamma, \beta)$ is realized unboundedly often below $\kappa^{+\omega+3}$ (or respectively, $\kappa^{+\omega+2}$);
2. for every bounded \(a \subseteq \beta\) of cardinality \(\leq \kappa\) there is \(\alpha < \beta\) corresponding to \(a\) in the enumeration of \([\kappa^{+\omega+3}]^{\leq \kappa}\) (or respectively \([\kappa^{+\omega+2}]^{\leq \kappa}\)).

The next two lemmas are proved in [?].

**Lemma 6.2.2** The set \(\{ \beta < \kappa^{+\omega+1} \mid \beta \text{ is } \omega\text{-good}\}\) contains a club, for every \(i < 2\).

**Lemma 6.2.3** Let \(0 < k \leq \omega\) and \(\beta\) be \(k\)-good. Then there are arbitrarily large \(k - 1\)-good ordinals below \(\beta\).

### 6.2.4 The Preparation Forcing \(\mathcal{P}'\)

The relevant preparation forcing \(\mathcal{P}'\) here will be just \(\mathcal{P}'\) of Gap 3 with \(\kappa\) replaced by \(\kappa^{+\omega}\) (and then \(\kappa^{+}\) by \(\kappa^{+\omega+1}\), \(\kappa^{++}\) by \(\kappa^{+\omega+2}\), \(\kappa^{+3}\) by \(\kappa^{+\omega+3}\)). So, models of cardinality \(\kappa^{+\omega+1}\) and those of cardinality \(\kappa^{+\omega+2}\) (ordinals) will be the only one used. This way the final forcing will satisfy only \(\kappa^{+\omega+2}\text{-c.c.}\) and the cardinals of the interval \([\kappa^{++}, \kappa^{+\omega+1}]\) will be collapsed. But that is what we actually desire. Thus \((\kappa^{+\omega+2})^V\) will be turned into \(\kappa^{++}\) and \((\kappa^{+\omega+3})^V\) into \(\kappa^{+3}\).

In order to force with \(\mathcal{P}'\) and preserve the desired strongness– the corresponded preparation should be made below \(\kappa\).

### 6.3 The Main Forcing

The next definition combines the Extender Based Magidor forcing with a certain short extenders forcing.

The forcing will change the cofinality of \(\kappa\) to \(\omega_1\) by adding to it a Magidor sequence \(\langle \kappa_\tau \mid \tau < \omega_1 \rangle\). For each \(\tau < \omega_1\), we will have \(2^{\kappa_\tau} \geq (\kappa_\tau^{+\omega+2})^V\). This will be due to the fact that extenders \(E(\kappa_\tau, \beta), \beta < \tau\) has length above \(\kappa_\tau^{+\omega+2}\) and nothing special (like new assignments and equivalence relations \(\longleftrightarrow\)) will be done for measures with indexes below \(\kappa_\tau^{+\omega+2}\). So the correspondence (assignment) will be here the natural one: \(\xi < \kappa_\tau^{+\omega+2}\) will correspond the \(\xi\)-th measure of the extenders over \(\kappa_\tau\).

If \(\tau \in S\), then we would like to have \(2^{\kappa_\tau} = (\kappa_\tau^{+\omega+3})^V\), and \(2^{\kappa_\tau} = (\kappa_\tau^{+\omega+2})^V\), whenever \(\tau \not\in S\). A new essential point in the present construction will be as follows. Let \(\tau \in S\). Suppose that \(\kappa_\tau\) is determined and it is a limit of \(\kappa_\nu\)'s with \(\nu \not\in S\). We would like that \(\{ \kappa_\nu^{+\omega+2} \mid \nu \not\in S\}\) correspond to \(\kappa_\tau^{+\omega+3}\), i.e. \(\{ \kappa_\nu^{+\omega+2} \mid \nu \not\in S\} \subseteq b_{\kappa_\tau^{+\omega+3}}\), where \(b_{\kappa_\tau^{+\omega+3}}\) is the pcf-generator. This already requires drops in cofinality. Thus we need some sequence to correspond to
\( \kappa_{\tau}^{+\omega+2} \). We will use \( \langle \kappa_{\tau_n}^{+\omega+2} | n < \omega \rangle \) for this purpose, where \( \langle \tau_n | n < \omega \rangle \) is a cofinal in \( \tau \) sequence consisting of successor ordinals that was reserved in advance. So not all of the set \( \{ \kappa_{\nu}^{+\omega+2} | \nu \notin S \} \) will be a part of \( b_{\kappa_{\tau}^{+\omega+3}} \), rather only

\[
\{ \kappa_{\nu}^{+\omega+2} | \nu \notin S \} \setminus \{ \kappa_{\tau_n}^{+\omega+2} | n < \omega \}.
\]

Suppose also that for every \( n < \omega \) we have \( \eta_n \notin S, \tau_n < \eta_n < \tau_{n+1} \) such that \( \kappa_{\eta_n}^{+\omega+2} \) is connected with \( \kappa_{\tau_n}^{+\omega+2} \) (i.e. basically \( \kappa_{\tau_n}^{+\omega+2} \in b_{\kappa_{\tau}^{+\omega+2}} \)). Note that since there are \( \aleph_1 \) many \( \tau \)’s and both \( S, \omega_1 \setminus S \) are stationary, situations like above always must occur. Let \( n < \omega \). We have that \( \kappa_{\eta_n}^{+\omega+2} \) is connected to \( \kappa_{\tau}^{+\omega+3} \), \( \kappa_{\tau_n}^{+\omega+2} \) is connected to \( \kappa_{\eta_n}^{+\omega+2} \) and \( \kappa_{\tau_n}^{+\omega+2} \) is connected to \( \kappa_{\tau}^{+\omega+2} \). This looks like a problem and in the actual setting has to do with the chain condition \( (\kappa_{\tau}^{+\omega+3} - \text{c.c.}) \) instead of the desired \( \kappa_{\tau}^{+\omega+2} - \text{c.c.} \). A way to overcome this difficulty will be as follows. Once we have two conditions such that in the first some \( \alpha < \kappa_{\tau}^{+\omega+3} \) corresponds to a measure \( \alpha^* < \kappa_{\tau}^{+\omega+2} \) of \( E(\kappa_{\tau}, \eta_n) \) and \( \alpha^* \) corresponds to a measure \( \gamma^* \) of \( E(\kappa_{\tau}, \tau_n) \) via the assignment of \( E(\kappa_{\tau}, \eta_n) \) (i.e. on a set of measure one for a maximal measure of the condition for \( E(\kappa_{\tau}, \eta_n) \)). In addition some \( \gamma < \kappa_{\tau}^{+\omega+2} \) corresponds to the measure \( \gamma^* \) of \( E(\kappa_{\tau}, \tau_n) \). Suppose the second condition is the same, but instead of \( \alpha \) we have some different ordinal \( \beta \), say \( \alpha < \beta \), but \( \alpha^* = \beta^* \) and the rest is the same.

We need to be able to put such two conditions into one stronger than both of them in order to verify the chain condition. Say we like to extend the first condition. So, as usual, we find some \( \mu > \alpha^* \) which realize the same type over the common part and attach it to \( \beta \) instead of \( \alpha^* \) (which corresponds to \( \beta \) in the second condition). The problem with this is that \( \alpha^* \) corresponds to \( \gamma^* \), but \( \mu \) does not.

But let us do the following: attach \( \mu \) to \( \gamma^* \) as well. So, in a sense, we loose a one to one correspondence of the assignment function for \( \kappa_{\eta_n}^{+\omega+2} \). In order to compensate this, let us require that the \( \alpha^*\)-th and \( \mu\)-th sequences to \( \kappa_{\eta_n} \) differ all the time above \( \kappa_{\tau_n} \).

The above will be implemented as follows. A non direct extensions of a condition which determine the value of \( \kappa_{\tau} \) will be allowed to identify \( \alpha^* \) and \( \mu \) as above, but then on a set of measure one for \( \kappa_{\tau} \) (i.e. with different choices of \( \kappa_{\tau} \)) they will be kept different.

Now, since a non-direct extensions can be made only at finitely many places (i.e. a condition decides only finitely many \( \kappa_{\tau} \)’s) the generic omega sequences corresponding from \( \kappa_{\eta_n} \) for \( \alpha^* \) and \( \mu \) will be eventually different.

We do not require that assignments between \( \kappa_{\tau}^{+\omega+2} \) and measures of \( E(\kappa_{\tau}, \eta_n) \) and between measures \( E(\kappa_{\tau}, \tau_n) \) and \( E(\kappa_{\tau}, \eta_n) \) are identity. i.e. \( \gamma < \kappa_{\tau}^{+\omega+2} \) corresponds to \( \gamma\)-th measure of \( E(\kappa_{\tau}, \eta_n) \), and \( \gamma\)-th measure of \( E(\kappa_{\tau}, \tau_n) \) corresponds to \( \gamma\)-th measure of \( E(\kappa_{\tau}, \eta_n) \).
Actually, it cannot be the identity once the above was implemented. The assignment functions however will be identity on $\kappa^+\omega+1$.

Let $\tau < \eta < \omega_1$. Denote the connection function between levels $\eta$ and $\tau$ by $a_{\eta\tau}$. There are five possibilities.

1. $\tau, \eta \not\in S$.
   Then we connect between $\kappa^{\omega+2}_\eta$ and $\kappa^{\omega+2}_\tau$.

2. $\tau, \eta \in S$.
   This implies that $\tau$ is not one of $\eta_n$’s.
   We connect $\kappa^{\omega+3}_\eta$ to both $\kappa^{\omega+2}_\tau$ and to $\kappa^{\omega+3}_\tau$.

3. $\eta \not\in S, \tau \in S$.
   Then we connect $\kappa^{\omega+2}_\eta$ to both $\kappa^{\omega+2}_\tau$ and to $\kappa^{\omega+3}_\tau$.

4. $\eta \in S, \tau \not\in S$ and $\tau = \eta_n$ for some $n < \omega$.
   Then we connect $\kappa^{\omega+2}_\eta$ to $\kappa^{\omega+2}_\tau$.

5. $\eta \in S, \tau \not\in S$ and $\tau$ is not one of $\eta_n$’s.
   Then we connect $\kappa^{\omega+3}_\eta$ to $\kappa^{\omega+2}_\tau$. Dropping in cofinality is used to deal with this case.

In all the cases $\kappa^{\omega+1}_\tau$ is connected to $\kappa^{\omega+1}_\tau$ and the connection between them is just the identity.

Let us explain more the cofinalities drops that will occur here. The complication is due to the fact that the cofinality from $\omega_1$ many places may drop to a same value. Thus, for example, $\tau_0$ may be the first element of the fixed $\omega$-sequence for $\omega_1$ many ordinals $\alpha < \omega_1$. So, we will have drops from $\kappa^+\omega+2_\alpha$ to $\kappa^{\omega+2}_\tau$ for $\omega_1$-many $\alpha$’s. This disturbs completeness of the forcing (at least direct extensions in it).

Let us deal with this as follows (the explanation continues with $\tau_0$, but $\tau_0$ may be viewed as an arbitrary point of the fixed $\omega$-sequence to arbitrary $\tau \in S$). Let us assume that $\tau' =: \tau_0+1$ is not in $S$ and is not a member of any of this fixed $\omega$-sequences. Then we would like to add $\kappa^{\omega+2}_\tau$-many $\omega$-sequences to $\kappa^{\omega+2}_\tau$. Now require that once $\kappa_{\tau_0}$ is determined, i.e. a non-direct extension of a condition was made over level $\tau_0$, then the same was done over $\tau'$ and $\kappa_{\tau'}$ is determined as well. $\kappa_{\tau'}$ is linked with the rest $\omega_1$ many cardinals (not yet determined) $\kappa^\omega_\beta$’s. We will now ”copy” more or less from $\kappa_{\tau'}$ to $\kappa^\omega_\beta$’s.

Let us clarify one subtle point in this context (i.e. once there are many drops to a single cofinality). Suppose for simplicity that $\omega \in S$, but $n \not\in S$, for each $n < \omega$. Suppose also that
\(2n \mid n < \omega\) is the fixed sequence for \(\omega\). In a generic extension (and we are interested only in its part below \(\kappa_\omega\)) let \(f_i\) be the generic \(\omega\)-sequence for \(i < \kappa^{+\omega+3}_\omega\). Then \(f_i \in \prod_{n<\omega} \kappa^{+\omega+3}_{2n+1}\), for \(i < \kappa^{+\omega+3}_\omega\). In addition, if \(\text{cof}(i) = \kappa^{+\omega+2}_\omega\), then \(\text{cof}(f_i(n)) = \kappa^{+\omega+2}_{2n+2}\), because of dropping in cofinality.

Let \(\langle g_j \mid j < \kappa^{+\omega+3}_\omega\rangle\) be generic \(\omega\)-sequences in \(\prod_{n<\omega} \kappa^{+\omega+3}_{2n+1}\), i.e. corresponding to \(\kappa^{+\omega+3}_\omega\). Let \(V_1 = V[\langle g_j \mid j < \kappa^{+\omega+3}_\omega\rangle]\).

Now suppose the following:

\((*)\) for every \(i < \kappa^{+\omega+3}_\omega\) of cofinality \(\kappa^{+\omega+2}_\omega\) (or just for stationary many of such \(i\)’s) there is a sequence \(\langle s(i, n) \mid n < \omega \rangle \in V_1\) such that for all but finitely many \(n\)’s \(s(i, n)\) is bounded in \(i\), but \(\{f_j(n) < f_i(n) \mid j \in s(i, n)\}\) is unbounded in \(f_i(n)\).

Work in \(V_1\). Consider a function \(i \mapsto \sup(\bigcup_{n<\omega} s(i, n))\). Find a stationary \(S \subseteq (\kappa^{+\omega+3}_\omega)^V\) on which it takes a constant value \(\delta\). Now, in \(V_1\), we still have \(\delta^{\kappa_\omega} = \kappa^{+\omega+2}_\omega < (\kappa^{+\omega+3}_\omega)^V\). Hence, there is \(S_1 \subseteq S\) stationary such that for every \(i, i' \in S_1\) we have \(\langle s(i, n) \mid n < \omega \rangle = s(i', n)\) for all \(n < \omega\).

Let now \(i < i'\) be in \(S_1\). Then in the full extension \((*)\) implies that for all but finitely many \(n\)’s we have \(f_i(n) = f_{i'}(n)\). Which is impossible and hence \((*)\) must fail.

The meaning of this is that in this type of a cofinality dropping it is impossible to relay completely (i.e. once arranging assignment functions) on points of a drop corresponding to smaller cofinality. This is a reason of taking \(\kappa_\tau\) and coping from it to relevant \(\kappa_{\beta}\)’s as was described above.

Let us explain the process of coping and assignment functions that allow it. For each \(\alpha < \beta < \omega_1\), we will have the assignment function \(a_{\beta\alpha}\) which will be as usual an isomorphism between suitable structures and \(f_{\beta\alpha}\) that comes from a Cohen part of a condition. As before the both components will be put together once a non-direct extension which decides \(\kappa_\alpha, \kappa_\beta\) was taken. The new element in the present context will be a commutativity.

Thus suppose that we have in addition \(\gamma, \beta < \gamma < \omega_1\). We would like require that

1. \(a_{\gamma\alpha} = a_{\beta\alpha} \circ a_{\gamma\beta}\),

2. \(f_{\gamma\alpha} = f_{\beta\alpha} \circ f_{\gamma\beta}\)

once non of \(\kappa_i\)’s is decided. Domains of \(f_{ij}\)’s are sets of pairs which have the first coordinates corresponding to potential choices of \(\kappa_j\)’s.

Suppose now that a non-direct extension was made and as a result \(\kappa_\alpha\) was decided. Then \(a_{\gamma\alpha}\) and \(a_{\beta\alpha}\) are incorporated into new \(f_{\gamma\alpha}\) and \(f_{\beta\alpha}\) respectively in the usual fashion. Now \(a_{\gamma\beta}\), \(f_{\gamma\beta}\) together with \(f_{\beta\alpha}\) should give \(f_{\gamma\alpha}\).
Assume that we have in addition $\alpha', \alpha < \alpha' < \beta$ such that a dropping occurs from $\gamma$ to $\alpha$ and $\alpha'$ at the same level, i.e. for some $n < \omega$, we have $\gamma_n < \alpha, \alpha' < \gamma_{n+1}$, where $(\gamma_n \mid \gamma < \omega)$ is the fixed sequence for $\gamma$. Assume also that $\kappa_{\alpha'}$ is not decided yet. Then we use $a_{\gamma\beta}, f_{\gamma\beta}$ to pick elements of the level $\beta$, i.e. over $\kappa_{\gamma\beta}$, and then $a_{\beta\alpha'}$ to move them down to the level $\alpha'$. Note that it is possible that $\beta \kappa < \alpha' < \beta_{k+1}$, for some $k < \omega$, and $\kappa_{\beta_k}$ is not decided yet.

Once $\kappa_{\beta}$ is decided, then the argument showing $\kappa_{\beta}^{+\omega+2}$–c.c. of the forcing up to $\kappa_{\beta}$ turns now the usual form.

One can try an other approach– instead of having single drops we allow $\omega$–many of possibilities for a drop. The problem with it is the closure of pcf–generators. Namely if we have some $\beta < \gamma$ with $\kappa_{\beta}^{+\omega+2}$ corresponding to $\kappa_{\gamma}^{+\omega+3}$ (i.e. $\kappa_{\beta}^{+\omega+2} \in b_{\kappa_{\gamma}^{+\omega+3}}$), $\kappa_{\beta}^{+\omega+2}$ is a dropping point which drops to cofinally in it many points below, then $\kappa_{\beta}^{+\omega+2} \in \text{pcf}(X_{\beta})$, where $X_{\beta}$ denotes the set of this points. Which eventually means that $\kappa_{\beta}^{+\omega+2}$ cannot correspond to $\kappa_{\gamma}^{+\omega+3}$.

Hence drops (the set $X_{\beta}$) are at least bounded in $\kappa_{\beta}$.

Let us point out that the set of places where drops occur (i.e. of a type of $\kappa_{\beta}^{+\omega+2}$ above) should be rather big. Thus for any stationary subset $Y \subseteq \omega_1$ there are $\beta \in Y$ and $\gamma > \beta$ such that $\kappa_{\beta}^{+\omega+2}$ corresponds to $\kappa_{\gamma}^{+\omega+3}$ and $\kappa_{\beta}^{+\omega+2}$ is a dropping point. Thus suppose otherwise. Let $Y$ be a stationary and for every $\beta \in Y$ and $\gamma > \beta$ we have $\kappa_{\beta}^{+\omega+2} \in b_{\kappa_{\gamma}^{+\omega+2}}$. Apply the argument of [7] to $Y$. We will have a contradiction to stationarity of $S$, namely there will not be $\gamma$ with $2^{\kappa_{\gamma}} = \kappa_{\gamma}^{+\omega+3}$ and which is a limit point of a stationary subset of $Y$.

The above means that the setting we chose is rather general.

Let us turn to formal definitions. First let us define pure conditions.

**Definition 6.3.1** (Pure conditions) The set $\mathcal{P}$ consists of sequences of the form

$$\langle \langle \xi, p^\xi \mid \xi \in s \rangle, \langle A_\alpha \mid \alpha < \omega_1 \rangle, \langle a_{\gamma\beta}, f_{\gamma\beta} \mid \beta < \gamma \leq \omega_1 \rangle, \langle a_{\beta\alpha}, f_{\beta\alpha} \mid \alpha < \beta \leq \text{o}\vec{E}(\delta), \delta < \kappa \rangle \rangle$$

satisfying the following conditions:

1. $s \subseteq \kappa^{+\omega+2}$ such that
   
   (a) $|s| \leq \kappa$,
   
   (b) $\max(s)$ exists and it is above every other element of $s$ in the order of each of the extenders $E(\kappa, \xi), \xi < \omega_1$.

2. $p^\xi$ is a finite increasing sequence of ordinals below $\kappa$.

3. $A_\alpha \in E(\kappa, \alpha)(\max(s))$,
4. $a_{\gamma\beta}$ is an assignment function (an isomorphism between suitable structures) over $\kappa$.
Let us state the particular properties $a_{\gamma\beta}$ related to the fixed stationary set $S$.

(a) If $\beta, \gamma \notin S$, then $a_{\gamma\beta}$ is an isomorphism between a generic suitable structure over $\kappa^{+\omega+2}$ and a suitable structure over $\kappa^{+\omega+2}$.
This eventually will connect $\kappa_{\gamma}^{+\omega+2}$ with $\kappa_{\beta}^{+\omega+2}$, where $\kappa_{\gamma}, \kappa_{\beta}$ are $\gamma$-th and $\beta$-th elements of a generic Magidor sequence.

(b) $\beta, \gamma \in S$, then $a_{\gamma\beta}$ is an isomorphism between a generic suitable structure over $\kappa^{+\omega+3}$ and a suitable structure over $\kappa^{+\omega+3}$, but so that ordinals correspond to models of cardinality $\kappa^{\omega+2}$ and $\kappa_{\gamma}^{\omega+2}$ drops down to $\kappa_{\gamma_{n}}^{\omega+2}$ where $\gamma_{n}$ is the maximal member $\leq \beta$ of the fixed cofinal in $\gamma$ sequence $\langle \gamma_{n} \mid n < \omega \rangle$.
This way we would like to connect $\kappa_{\gamma}^{\omega+2}$ with both $\kappa_{\beta}^{\omega+3}$ and $\kappa_{\beta}^{\omega+2}$, in addition $\kappa_{\gamma}^{\omega+2}$ will drop to $\kappa_{\gamma_{n}}^{\omega+2}$.

Note, that due to the dropping, the cardinality of $a_{\gamma\beta}$ should be $\kappa_{\gamma_{n}}$, once we have $\kappa_{\gamma_{n}}$ is decided. It is bad (Prikry condition) to keep the cardinality of $a_{\gamma\beta}$ below $\kappa$ and then to choose $\kappa_{\gamma_{n}}$ above it. Instead let us allow the cardinality of $a_{\gamma\beta}$ to be a name which depends on the choice of $\kappa_{\gamma_{n}}$. Recall that in cofinality drops $\text{rng}(a_{\gamma\beta})$ depends on the choice of a point from $A_{\gamma_{n}}$. So, here also the domain is a name, but both are always subsets of the support of the condition $s$.

(c) If $\gamma \notin S$ and $\beta \in S$, then $a_{\gamma\beta}$ is an isomorphism between a generic suitable structure over $\kappa^{+\omega+2}$ and a suitable structure over $\kappa^{+\omega+3}$ so that ordinals correspond to models of cardinality $\kappa^{\omega+1}$.
This way we would like to connect $\kappa_{\gamma}^{+\omega+2}$ with both $\kappa_{\beta}^{+\omega+3}$ and $\kappa_{\beta}^{+\omega+2}$. Thus, if $\xi \in \text{dom}(a_{\gamma\beta}) \cap \text{On}$ then $a_{\gamma\beta}(\xi)$ will be a model of the size $\kappa^{+\omega+1}$. $a_{\gamma\beta}(\xi) \cap \kappa^{+\omega+2}$ will be an ordinal. We have here a kind of splitting where $\xi$ corresponds to both an ordinal $a_{\gamma\beta}(\xi) \cap \kappa^{+\omega+2}$ for $\omega + 2$ and a model $a_{\gamma\beta}(\xi)$ for $\omega + 3$. No drops are needed in this case.

(d) If $\gamma \in S$ and $\beta = \gamma_{n}$, for some $n < \omega$ (and, in particular, $\beta \notin S$), then $a_{\gamma\beta}$ is an isomorphism between a generic suitable structure over $\kappa^{+\omega+2}$ and a suitable structure over $\kappa^{+\omega+2}$.
This eventually will connect $\kappa_{\gamma}^{+\omega+2}$ with $\kappa_{\beta}^{+\omega+2}$.

(e) If $\gamma \in S, \beta \notin S$ and $\beta$ is not one of $\gamma_{n}$'s, then $a_{\gamma\beta}$ is an isomorphism between a generic suitable structure over $\kappa^{+\omega+3}$ and a suitable structure over $\kappa^{+\omega+2}$, but so that $\kappa^{+\omega+2}$ drops down to the maximal $\gamma_{n} \leq \beta$, where $\langle \gamma_{n} \mid n < \omega \rangle$ is the fixed
cofinal in $\gamma$ sequence.
This way $\kappa_{\gamma}^{+\omega+3}$ will be connected with $\kappa_{\beta}^{+\omega+2}$. In addition $\kappa_{\gamma}^{+\omega+2}$ will drop to $\kappa_{\gamma}^{+\omega+2}$.

5. $a_{\beta\alpha}^\delta$ is an assignment function (an isomorphism between suitable structures) over $\delta$.
   It satisfies the conditions 4a–4e above only with $\kappa$ replaced by $\delta$.

6. $f_{\gamma\beta}$ is a partial function of cardinality at most $\kappa$ from $\kappa^{+\omega+3}$ to $\kappa$,
7. $f_{\delta\beta}^\delta$ is a partial function of cardinality at most $\delta$ from $\delta^{+\omega+3}$ (or from $\delta^{+\omega+2}$) to $\delta$,
8. (Disjointness of domains)
   - $\text{dom}(a_{\gamma\beta}) \cap \text{dom}(f_{\gamma\beta}) = \emptyset$, for every $\beta < \gamma < \omega_1$.
   - $\text{dom}(a_{\beta\alpha}^\delta) \cap \text{dom}(f_{\beta\alpha}^\delta) = \emptyset$, for every $\alpha < \beta < o_{E}(\delta)$.

Let us state now the conditions which deal with a commutativity.

9. $a_{\gamma\alpha} = a_{\gamma\beta} \circ a_{\beta\alpha}$, for each $\alpha < \beta < \gamma < \omega_1$,
10. $a_{\gamma\alpha}^\delta = a_{\gamma\beta}^\delta \circ a_{\beta\alpha}^\delta$, for each $\alpha < \beta < \gamma < o_{E}(\delta)$.
    Note that only $\text{dom}(a_{\omega_1 \beta}) \subseteq s$. If $\gamma < \omega_1$ and $\gamma \in S$, then $\text{dom}(a_{\omega_1\beta}) \subseteq \kappa^{+\omega+3}$ which may be larger than $s$. Our main interest will in the type $\text{dom}(a_{\gamma\beta})$ realizes and further the equivalence relation ($\longleftrightarrow$) will identify conditions accordingly.

11. If $\nu \in \text{dom}(a_{\gamma\beta})$ and $\text{cof}(\nu) = \kappa^+$, then $\text{cof}(a_{\gamma\beta}(\nu)) = \kappa^+$.
    Note that such $\nu$'s will be usually non–limit points, since there will be drops in cofinalities.

The next conditions deal with compatibility.

12. (Compatibility) For each $\beta < \gamma < \omega_1$ and $\eta \in A_{\gamma}$ we require that

   $$ a_{\gamma\beta}^\eta \bigcup \{ \langle \xi, \bar{\rho} \rangle \mid \text{there are } \langle \xi, \rho \rangle \in a_{\gamma\beta} \text{ such that } \eta \text{ is permitted to both }
   p^\xi, p^\rho, \pi_{\max(s),\xi}(\eta) = \bar{\xi} \text{ and } \pi_{\max(s),\rho}(\eta) = \bar{\rho} \} $$

   is a function and it is an order preserving (or even an isomorphism between suitable structures.

   This means that the copy of $a_{\gamma\beta}$ over $\eta$ is compatible with the ”local” function $a_{\gamma\beta}^\eta$.

13. For every $\alpha < \beta < \gamma < \omega_1$ and $\xi \in \text{dom}(f_{\gamma\alpha})$ the following hold:
(a) $\xi \in \text{dom}(f_{\gamma\beta})$,
(b) if $\nu = f_{\gamma\alpha}(\xi)$ and $\delta = f_{\gamma\beta}(\xi)$, then $\alpha(\delta^0) > \alpha$ implies $f_{\alpha(\delta^0)\alpha}(\delta) = \nu$.

14. For every $\gamma < \omega_1$, $\xi \in \bigcup_{\beta < \gamma} \text{dom}(a_{\gamma\beta})$ and $k < \omega$
the following set is a final segment in $\gamma$:
$$\{ \beta < \gamma \mid a_{\gamma\beta}(\xi) \text{ is defined and } k \text{ good} \}.$$  

Let us deal now with the following situation. Suppose that $\gamma \in S$, $\alpha < \gamma$, $\alpha \notin \{ \gamma_i \mid i < \omega \}$ and $n < \omega$ is a maximal such that $\gamma_n < \alpha$. Then $\kappa_\gamma^{+\omega+2}$ is connected with $\kappa_\gamma^{+\omega+2}$ and $\kappa_\gamma^{+\omega+3}$ with $\kappa_\alpha^{+\omega+2}$, and if $\alpha \in S$, then also with $\kappa_\alpha^{+\omega+3}$. On the other hand $\kappa_\alpha^{+\omega+2}$ is connected with $\kappa_\alpha^{+\omega+2}$, $\alpha \notin S$ and $\kappa_\alpha^{+\omega+3}$ is connected with $\kappa_\alpha^{+\omega+3}$, if $\alpha \in S$, but $\gamma_n \notin \{ \alpha_i \mid i < \omega \}$. We need to break down this connections between $\alpha$ and $\gamma_n$ in order to keep the thing working. Namely the $\kappa_\gamma^{+\omega+2}$ chain condition of the forcing at the level $\gamma$ is effected. It is easy to deal with a single $\gamma_n$ (or with $\{ \gamma_i \mid i \leq n \}$). We can just identify images at the level $\gamma_n$ of different ordinals (or models) from the level $\alpha$.

The situation starts to be more involved once instead of a single $\gamma$ we have $\omega$–many with the corresponding $\gamma_n$’s unbounded in $\alpha$. This always occurs due to stationarity of $S$. The problem in this case is that if we identify too much, then there will not be enough $\omega$–sequences to make $2^{\omega_\alpha}$ big.

Let us state now conditions that allow to identify certain ordinals (models), but still keep many sequences different.

15. Suppose $\delta \in A_\gamma$, for some $\gamma \in S$. Then $\sigma^E(\delta^0) = \gamma$. Consider $a^\delta_{\gamma\alpha}, a^\delta_{\gamma\gamma_n}$, where $\alpha < \gamma$ and $n < \omega$ is the maximal such that $\gamma_n < \alpha$.

We have a connection $a^\delta_{\gamma\gamma_n}$ between $\kappa_\alpha$ and $\kappa_\gamma$. Let us disturb it. We will allow to identify some values. There is $\bar{a}^\delta_{\gamma\gamma_n} \subseteq a^\delta_{\alpha\gamma_n}$ on which $a^\delta_{\alpha\gamma_n}$ is order preserving (or isomorphism) but the rest of $\text{dom}(a^\delta_{\alpha\gamma_n})$ is mapped into the image of $\bar{a}^\delta_{\alpha\gamma_n}$ by $a^\delta_{\alpha\gamma_n}$.

It will be allowed to change $\bar{a}^\delta_{\alpha\gamma_n}$ (once extending a condition) and to pass to a different set on which the order is preserved.

Now suppose that instead of a single $\gamma_n$ (or even bounded many ones) $\alpha$ is a limit of ordinals $\xi_i$ which members of the $\omega$–sequences for ordinals $\xi \geq \gamma$.

Then for each such such $\xi_i$ we will have a set $\bar{a}^\delta_{\alpha\xi_i} \subseteq a^\delta_{\alpha\xi_i}$ on which $a^\delta_{\alpha\xi_i}$ is order preserving (or isomorphism). Require the following:

(a) if $\nu, \mu$ are in the support over $\kappa_\alpha$ and $\nu \neq \mu$, then the set
$$\{ j < \alpha \mid a^\delta_{\alpha\xi_j}(\nu) = a^\delta_{\alpha\xi_j}(\mu) \}$$
is bounded in $\alpha$;

(b) (Minimality) if $\nu, \mu$ are in the support over $\kappa_\alpha$, $\nu \in \tilde{a}_{\alpha,i}^\delta$, and $a_{\tilde{a}_{\alpha,i}^\delta}(\nu) = a_{\tilde{a}_{\alpha,i}^\delta}(\mu)$, then $\mu \geq \nu$.

Let us explain how the above condition allows to run the chain condition argument. We will need to prove $\kappa_\gamma^{+\omega+2}$-c.c. of the forcing up to the level $\gamma$. As usual a $\Delta$-system is formed and at the final stage of the argument we will need to put together two conditions with indexes from it. The problem here is that the kernel of the $\Delta$-system includes the parts of both conditions over $\kappa^{+\omega+2}_\gamma$. The assignment functions then will move this common part to $\kappa^{+\omega+2}_\gamma$. So over the level $\alpha$ we will have different things that should correspond to the same one over the level $\gamma_n$. Suppose for simplicity that $\alpha \notin S_n$. Then (over $\kappa_\alpha$) we will have the kernel $x$ (the image under $a_{\tilde{a}_{\alpha,i}^\delta}$’s) the rest of the first condition (again only over $\kappa_\alpha$) $y$ and the second $z$ above it. We need to identify the images of $y$ and $z$ over the level $\gamma_n$, but still keep them different or even one above the other co-boundedly often. Denote by $\bar{y}, \bar{z}$ the parts on which we have the order preservation. Let $\nu = \min(\bar{y} \setminus x)$ and $\mu = \min(\bar{z} \setminus z)$. The sequences for $\nu$ and for $\mu$ behave the same way (i.e. equal, less, bigger) relatively the sequences for members of $x$, as parts of the $\Delta$-system. Densely often above the level $\gamma$ and hence in the sequence of conditions above the level $\gamma$ used to determine the members of the antichain over $\gamma$, both $\nu$ and $\mu$ appear. So, their sequence from the level $\alpha$ differ on a co-bounded subset. This means that a final segment of both of them differs from any of the sequences of the kernel $x$ as well as one from an other. In particular this means that $\nu = \min(y)$ and $\mu = \min(z)$, by the minimality item above. Now we can combine the conditions together.

The following situation is still problematic once using the approach above. There always will be $\gamma < \omega_1$ which is a limit of an increasing sequence $\langle \beta_n \mid n < \omega \rangle$ of members of $S$ such that all of $\beta_n$’s have the same first dropping point $\tau$. Suppose a non-direct extension is made at $\tau$ how do we gain unbounded in $\gamma$ degrees of completeness? An other but a related problem is how do we connect $\gamma$’s level to levels below in particular to $\beta_n$’s and their dropping points?

Let us use models of cardinality $\kappa_\alpha^{+\omega+1}$ as values of $a_{\gamma\alpha}$ (the assignment function from the level $\gamma$ to a level $\alpha$). In particular, $\kappa_\gamma^{+\omega+2}$ connects to both $\kappa_\beta^{+\omega+2}$ and $\kappa_\beta^{+\omega+3}$ ($\beta$ is one of $\beta_n$’s). Thus $a_{\gamma\beta}(A)$ ($A \in \text{dom}(a_{\gamma\beta})$)is a submodel of size $\kappa_\beta^{+\omega+1}$ of $\kappa_\beta^{+\omega+3}$ and the connection to $\kappa_\beta^{+\omega+2}$ will be $a_{\gamma\beta}(A) \cap \kappa_\beta^{+\omega+2}$. 

152
We require that $a_{\gamma\beta}(A)$ is not a limit model relatively to those over $\kappa_{\beta}^{+\omega+3}$ (i.e. there is a last model from the chain of models of $\kappa_{\beta}^{+\omega+3}$ below it), unless it is a limit of cofinality below $\kappa_{\beta}$.

This is needed for $\kappa_{\beta}^{+\omega+2}$-c.c. of the forcing restricted to $\kappa_{\beta}$. Thus in the kernel of the $\Delta$-system will not split then models of the form $a_{\gamma\beta}(A)$, but rather the original ones from $\kappa_{\beta}^{+\omega+3}$.

Suppose now that $\alpha < \beta$ is a dropping point for $\beta$ which drops to the level $\tau$. We require commutativity of the assignments (as far as no non-direct extension was made). This is more or less necessary due to smoothness (transitivity) of pcf-generators.

The sizes of domains seem to be problematic, but let as arrange this as follows. The domain of $a_{\beta\alpha}$ may have size $\kappa_{\alpha}$ (and not $\kappa_{\tau}$ as usually once dropping to $\tau$), but the maximal model of the range has size $\kappa_{\tau}$. Models of sizes $\kappa_{\beta}^{+\omega+1}$ are allowed in the range of $a_{\beta\alpha}$ (this size is typical for models in the range of $a_{\gamma\beta}$). They come in blocks with each block having a maximal model, the number of blocks is at most $\kappa_{\tau}$. Only blocks are required to be members of models of smaller size (i.e. $\in$-relation is not fully preserved). The rest of conditions are the same as for the usual drops.

Let us address the situation where a non-direct extension was made over $\tau$, i.e. $\kappa_{\tau}$ was decided. Now the further connection from $\kappa_{\beta}$ to $\kappa_{\alpha}$ ($\kappa_{\alpha}$ is not decided yet, but here we have a drop which leads to a luck of closure) is allowed not to be one to one. Namely, outside of the images of models from $\kappa_{\gamma}$ (remember that we required them to be non limit) we have intervals where it is allowed not to be one to one.

Suppose that $\alpha' > \alpha$ is also a dropping point to $\tau$. In a pure condition we will have the maximal models $A_{\alpha}$ and $A_{\alpha'}$ at levels $\alpha, \alpha'$ of cardinality $\kappa_{\tau}^{+\omega+2}$. We require them to be order isomorphic. The idea is that once $\kappa_{\alpha}$ (or $\kappa_{\alpha'}$) is decided, then we copy via this order isomorphism the assignments inside $A_{\alpha}$ to those inside $A_{\alpha'}$ (or from $A_{\alpha'}$ to $A_{\alpha}$, if $\kappa_{\alpha'}$ was decided). The same thing will be done with the rest of models of sizes $\kappa_{\tau}^{+n+1}$, i.e. the assignment functions inside corresponding models (some different models are allowed to correspond to a same model) will be copied via order isomorphisms. No requirements outside will be made. So inside small models one to one correspondence may break down, however outside we will have it together with more closure of the forcing.

The number of small models (over $\kappa_{\alpha}$) need to be big ($\kappa_{\alpha}$ ) in order to have the Prikry condition of the forcing. So we have the maximal model $A_{\alpha}$ of the small size and inside it model $B_{\alpha}$ of the big size which has a long sequence of big and small models inside.
We continue now the definition in order to realize this idea precisely.

16. Suppose we have \( \tau < \alpha, \alpha' < \beta < \gamma, \beta, \tau < \alpha, \alpha' \in S, \gamma \in \omega_1 \setminus S, \alpha, \alpha' \) in the fixed \( \omega \)-sequence of \( \beta \). Assume that we have droppings from the levels \( \alpha, \alpha' \) to \( \tau \) for \( \beta \).

If a model \( A_\alpha \in \text{dom}(a_{\beta\alpha}) \), then \( A_\alpha \in \text{dom}(a_{\beta\alpha'}) \) unless there is \( B \supseteq A_\alpha \) in \( \text{dom}(a_{\beta\alpha'}) \) with \( a_{\beta\alpha'}(B) \) being is 2–good but not more.

Intuitively we would like to have the situation in which all \( a_{\beta\alpha} \) have the same domain, for \( \alpha \) in the \( \omega \)-sequence of \( \beta \). In the situation with \( B \) above it is impossible to find a candidate for the image of \( A_\alpha \). So we require that this are the only cases.

Let us formulate a similar condition which involves different \( \beta \)'s.

17. Suppose we have \( \tau < \alpha < \beta, \tau < \alpha' < \beta' < \gamma, \beta \leq \beta', \beta, \beta' \in S, \gamma \in \omega_1 \setminus S, \alpha \) in the fixed \( \omega \)-sequence of \( \beta \) and \( \alpha' \) in the fixed \( \omega \)-sequence of \( \beta' \). Assume that we have droppings from the levels \( \alpha, \alpha' \) to \( \tau \) for both \( \beta \) and \( \beta' \).

If a model \( A_\alpha \in \text{dom}(a_{\beta\alpha}) \), then there is \( A_{\alpha'} \in \text{dom}(a_{\beta\alpha'}) \) such that \( a_{\beta\tau}(A_\alpha \cap \kappa^+_{\beta\alpha} + \omega^2) = a_{\beta\tau}(A_{\alpha'} \cap \kappa^+_{\beta\alpha'} + \omega^2) \), unless there is \( B \in \text{dom}(a_{\beta\alpha'}) \) with \( a_{\beta\alpha'}(B) \) being is 2–good but not more, \( a_{\beta\tau}(B \cap \kappa^+_{\beta\alpha'} + \omega^2) > a_{\beta\tau}(A_{\alpha'} \cap \kappa^+_{\beta\alpha'} + \omega^2) \) and there is no way to add a model \( A \subseteq B \) with \( a_{\beta\tau}(B \cap \kappa^+_{\beta\alpha'} + \omega^2) > a_{\beta\tau}(A \cap \kappa^+_{\beta\alpha'} + \omega^2) \geq a_{\beta\tau}(A_{\alpha'} \cap \kappa^+_{\beta\alpha'} + \omega^2) \).

18. Suppose we have \( \tau < \alpha < \beta, \tau < \alpha' < \beta' < \gamma, \beta \leq \beta', \beta, \beta' \in S, \gamma \in \omega_1 \setminus S, \alpha \) in the fixed \( \omega \)-sequence of \( \beta \) and \( \alpha' \) in the fixed \( \omega \)-sequence of \( \beta' \). Assume that we have droppings from the levels \( \alpha, \alpha' \) to \( \tau \) for both \( \beta \) and \( \beta' \).

Let \( A_\alpha \) and \( A_{\alpha'} \) be models in \( \text{dom}(a_{\beta\alpha}), \text{dom}(a_{\beta\alpha'}) \) with \( a_{\beta\tau}(A_\alpha \cap \kappa^+_{\beta\alpha} + \omega^2) = a_{\beta\tau}(A_{\alpha'} \cap \kappa^+_{\beta\alpha'} + \omega^2) \).

We would like to have then a certain correspondence between \( a_{\beta\alpha}(A_\alpha) \) and \( a_{\beta\alpha'}(A_{\alpha'}) \) specially once a non-direct extension taken at one of them.

Suppose a non-direct extension was made at \( \alpha \).

(a) If \( \beta = \beta' \) and \( \xi, \zeta < \kappa^+_{\beta\alpha} + 3 \) are so that \( \xi \in \text{dom}(a_{\beta\alpha}), \text{dom}(a_{\beta\alpha'}) \), \( \zeta \) is in \( A_\alpha \) (but probably in \( \text{dom}(f_{\beta\alpha}) \), and so not in \( \text{dom}(a_{\beta\alpha}) \)) but does not belong to any model in \( A_\alpha \) of bigger cardinality (i.e. \( \zeta \) may belong to models smaller than \( A_\alpha \) but of small cardinality and above the last model inside \( A_\alpha \) of large cardinality. In particular \( A_\alpha \) can be a limit model but there is a largest model inside \( A_\alpha \) of bigger cardinality and \( \zeta \) not in it) and the value corresponding to \( a_{\beta\alpha}(\xi) \) in the non-direct extension is the same as \( f_{\beta\alpha}(\zeta) \), then we link \( \zeta \) with \( a_{\beta\alpha'}(\xi) \).

The limitation on \( \zeta \) is needed in order to be able to put together similar conditions.
while running the chain condition argument. We like to avoid the situation when ζ appears in the kernel of a Δ–system but it should correspond to different points ξ and ξ′ (which copy one an other) of two conditions that should be combined.

(b) If β ≠ β′ and ξ < κβ⁺ω⁺³, ξ ∈ dom(aβα), then we first use aγβ, aγβ′ to find ξ′ < κγβ⁺ω⁺³, ξ′ ∈ dom(aγβ′a′) which corresponds to ξ as follows: ξ′ = aγβ(aγβ⁻¹(ξ)).

Now given ζ as above, we link ξ′ with aγβ′a′(ξ′), where ζ′ = aγβ′(aγβ⁻¹(ζ)).

This completes the first definition.

Define a direct extension order ≤* on преобразования in the obvious fashion as follows.

**Definition 6.3.2** (Direct extension order) Let p = ⟨⟨ξ, pξ⟩ | ξ ∈ s⟩, ⟨Aα | α < ω1⟩, ⟨aγβ, fγβ | β < γ ≤ ω1⟩, ⟨aγβα, fγβα | α < β ≤ o^β(δ), δ < κ⟩⟩ and q = ⟨⟨ξ, qξ⟩ | ξ ∈ t⟩, ⟨Bα | α < ω1⟩, ⟨bγβ, gγβ | β < γ ≤ ω1⟩, ⟨bγβα, gγβα | α < β ≤ o^β(δ), δ < κ⟩⟩ be in преобразования. Set q ≤* p iff

1. s ⊇ t,
2. pξ = qξ, for every ξ ∈ t,
3. πα max(s, max(t)) Aα ⊆ Bα, for every α < ω1,
4. aγβ ⊇ bγβ, for every β < γ < ω1,
5. fγβ ⊇ gγβ, for every β < γ < ω1,
6. aγβα ⊆ bγβα, for every α < β ≤ o^β(δ), δ < κ,
7. fγβα ⊆ gγβα, for every α < β ≤ o^β(δ), δ < κ.

Let us define now an extension of a pure condition by one element.

**Definition 6.3.3** (One element extension) Let p = ⟨⟨ξ, pξ⟩ | ξ ∈ s⟩, ⟨Aα | α < ω1⟩, ⟨aγβ, fγβ | β < γ ≤ ω1⟩, ⟨aγβα, fγβα | α < β ≤ o^β(δ), δ < κ⟩⟩ ∈ преобразования, β < ω1 and η ∈ Aβ. Define the extension of p by η, p⁻η. It consists of two parts the upper part p^αp and the lower part p^lo, where

\[ p^αp = \langle \langle ξ, pξ \rangle | ξ ∈ s \text{ and } η \text{ not permitted for } pξ, (Aα \setminus η) \text{ or } o^β(η) < α < ω1 \rangle, \]
\[ (aγβ, fγβ | o^β(η) < β < γ ≤ ω1), (aγβα, fγβα | o^β(η) < α < β ≤ o^β(δ), η < δ < κ) \]
\[ (fγηo^β(η) | o^β(η) < γ < ω1), (fγηαo^β(η) | o^β(η) < γ ≤ o^β(δ)), (fγηo^β(η) | o^β(η) < γ ≤ ω1) \].

155
\[ p^{\ell_0} = \langle \pi_{\text{max}(s), \xi(\eta), P^\xi} \mid \xi \in s \text{ and } \eta \text{ is permitted for } P^\xi \rangle, \langle A_\alpha \cap \eta \mid \alpha > \sigma^E(\eta) \rangle, \langle \bar{a}_{\gamma \beta}^\eta, f_{\gamma \beta}^\eta \mid \beta < \gamma \leq \sigma^E(\eta) \rangle, \langle a_{\beta \alpha}^\delta, f_{\beta \alpha}^\delta \mid \alpha < \beta \leq \sigma^E(\delta), \delta < \eta^0 \rangle, \]

where

1. \( \bar{f}_{\gamma \alpha}^\eta(\eta) \) is a combination of \( f_{\gamma \alpha}^\eta(\eta) \) with \( a_{\gamma \alpha}^\eta(\eta) \), i.e.

\[
\bar{f}_{\gamma \alpha}^\eta = f_{\gamma \alpha}^\eta \cup \{ \xi \mid (f_{\gamma \alpha}^\eta(\xi))^{\ell_0} = \eta^0 \} \cup \\
\{ \langle \xi, \pi_{\text{max}(s), a_{\gamma \alpha}^\eta(\eta)}(\xi) \rangle \mid \xi \in \text{dom}(a_{\gamma \alpha}^\eta(\eta)), \eta \text{ is permitted for } P^\xi \}.
\]

Note that \( a_{\gamma \alpha}^\eta(\eta) \) may be a name according to Definition 6.3.1(4b). So in such a case also \( \bar{f}_{\gamma \alpha}^\eta(\eta) \) will be a name.

It is important that all connections between the upper part (including \( \eta \)) and the lower part go through the level \( \eta \). This way a completeness of the upper part regains.

Note also that the following situation may occur:

the connection between levels \( \gamma \) and \( \alpha \) (i.e. \( a_{\gamma \alpha} \)) used models of greater cardinality than those between \( \sigma^E(\eta) \) and \( \alpha \), for some \( \alpha < \sigma^E(\eta) \). If this happen, then we still base the connection between \( \sigma^E(\eta) \) and \( \alpha \) (i.e. \( \bar{a}_{\gamma \alpha}^\eta(\eta) \)) on smaller models, but require that the largest of bigger size belongs to one of the smaller size.

2. \( \bar{a}_{\gamma \beta}^\eta = a_{\gamma \beta}^\eta \), unless \( \gamma = \sigma^E(\eta) \). If \( \gamma = \sigma^E(\eta) \), then \( \bar{a}_{\gamma \beta}^\eta \) is the combination of \( a_{\gamma \beta}^\eta \) with the copy of \( a_{\gamma \beta} \) over \( \eta \), i.e.

\[
\bar{a}_{\gamma \beta}^\eta = a_{\gamma \beta}^\eta \cup \{ \langle \xi, \hat{\rho} \rangle \mid \text{there are } \langle \xi, \rho \rangle \in a_{\gamma \beta} \text{ such that } \eta \text{ is permitted to both} \}
\]

\[
p^\xi, p^\rho, \pi_{\text{max}(s), \xi(\eta)} = \bar{\xi} \text{ and } \pi_{\text{max}(s), \rho(\eta)} = \bar{\rho} \}.
\]

Note that such defined \( \bar{a}_{\gamma \beta}^\eta \) is an order preserving function by 6.3.1 (12).

The connection \( a_{\epsilon \beta} \), for \( \epsilon \)'s above \( \sigma^E(\eta) \), is replaced now by the composition of \( f_{\epsilon, \sigma^E(\eta)}^\eta \) (or its further extensions) with \( \bar{a}_{\epsilon \beta}^\eta(\eta) \).

Denote the set of one element extensions of elements of \( \bar{P} \) by \( \bar{P}_1 \). Extend \( \leq^* \) to \( \bar{P}_1 \) in the obvious fashion. Repeat Definition 6.3.3 and define \( \bar{P}_2 \) to be the set of one element extensions of elements of \( \bar{P}_1 \), etc.

Finally set

\[
\bar{P} = \bigcup_{n<\omega} \bar{P}_n,
\]

where \( \bar{P}_0 = \bar{P} \). Extend \( \leq^* \) to \( \bar{P}_n \)'s and \( \bar{P} \) in the obvious fashion.

156
Definition 6.3.4 (Order) Let $p, q \in \mathcal{P}$. Set $p \geq q$ iff there exists a finite sequence $\langle r_k \mid k < n < \omega \rangle$ of elements of $\mathcal{P}$ such that

1. $r_0 = q$,
2. $r_{n-1} = p$,
3. $r_k \leq r_{k+1}$ or $r_{k+1}$ is a one element extension of $r_k$, for every $k < n - 1$.

Let $p \in \mathcal{P}$ and for some $\alpha < \omega_1$ the value of $\kappa_\alpha$ is decided. Then $p$ splits naturally into two parts – the part $p_{\leq \alpha}$ from the level $\alpha$ down and the part $p_{> \alpha}$ above the level $\alpha$.

Definition 6.3.5 Let $\alpha < \omega_1$.

1. Set $\mathcal{P}_{\leq \alpha}$ to be the set of all $p_{\leq \alpha}$ with $p \in \mathcal{P}$ which decides $\kappa_\alpha$.
2. Set $\mathcal{P}_{> \alpha}$ to be the set of all $p_{> \alpha}$ with $p \in \mathcal{P}$ which decides $\kappa_\alpha$.

Lemma 6.3.6 Let $\alpha < \omega_1$. Then $\langle \mathcal{P}_{> \alpha}, \leq^* \rangle$ is $\kappa_\alpha^+$-closed forcing.

Proof. The proof follows from the way conditions split–namely 6.3.3(1).

□

Lemma 6.3.7 (Prikry condition)
$\langle \mathcal{P}, \leq, \leq^* \rangle$ satisfies the Prikry condition.

Proof. The complication that appears in Definition 6.3.1(16-18) requires a special treatment. Let us preserve the notation used there.

Suppose that we run through the set of measure one over $\alpha$–th level. We allow two basic possibilities of a non–direct extension:
(a) pick some $\nu$ from the set of measure one as it is;
(b) make first a direct extension and move to a bigger maximal coordinate and only then pick some $\rho$ in a new set of measure one with projection to the old maximal coordinate $\nu$.

In the second case let us pick a model of larger cardinality which includes the direct extension made and let us keep them for the next step. Continue then to the next $\nu$ (from the new set of measure one).

The total number of steps needed is $\kappa_\alpha$ which is too big for both sizes of possible models. In order to handle this let us use ”barriers”, i.e. if $\nu$ is in the final set of measure one, then we
consider $\nu^0$ (the projection to the normal measure) and project $\nu$ down only to the places with the value of the barrier $\leq \nu^0$. Eliminate the rest of the places.

Given above and Lemma 6.3.6 the rest is standard.

\[\square\]

6.4 The Main Forcing Order

Define a partial order $\rightarrow$ on $P$ such that $\langle P, \rightarrow \rangle$ will be nice subforcing of $\langle P, \leq \rangle$ and $\langle P_{\leq \alpha}, \rightarrow \rangle$ will satisfy $\kappa_\alpha^{+\omega+2}$-c.c., for every $\alpha < \omega_1$.

We start with a definition of equivalences $\leftrightarrow$.

Definition 6.4.1 (Equivalence of pure conditions) Let $\eta < \omega_1$,

\[p = \langle \langle \xi, p^\xi \mid \xi \in s \rangle, \langle A_\alpha \mid \alpha < \eta \rangle, \langle a_{\gamma \beta}, f_{\gamma \beta} \mid \beta < \gamma \leq \eta \rangle, \langle a^\delta_{\beta \alpha}, f^\delta_{\beta \alpha} \mid \alpha < \beta \leq \delta \leq \kappa_\eta \rangle \rangle\]

\[q = \langle \langle \xi, q^\xi \mid \xi \in t \rangle, \langle B_\alpha \mid \alpha < \eta \rangle, \langle b_{\gamma \beta}, g_{\gamma \beta} \mid \beta < \gamma \leq \eta \rangle, \langle b^\delta_{\beta \alpha}, g^\delta_{\beta \alpha} \mid \alpha < \beta \leq \delta \leq \kappa_\eta \rangle \rangle\]

be in $P_{\leq \eta}$.

Set $p \leftrightarrow_{\eta} q$ iff the following hold:

1. $s = t$,
2. $A_\alpha = B_\alpha$ for each $\alpha < \eta$,
3. $p^\xi = q^\xi$ for every $\xi \in s$,
4. $f_{\gamma \beta} = g_{\gamma \beta}$, for every $\beta < \gamma \leq \eta$,
5. $f^\delta_{\beta \alpha} = g^\delta_{\beta \alpha}$, for every $\alpha < \beta \leq \delta \leq \kappa_\eta$,
6. $a_{\gamma \beta} = b_{\gamma \beta}$, for every $\alpha < \beta \leq \delta \leq \kappa_\eta$,
7. $a_{\gamma \beta} = b_{\gamma \beta}$, $\beta < \gamma \leq \eta$,
8. $\text{dom}(a_{\eta \gamma}) = \text{dom}(b_{\eta \gamma})$, for every $\gamma < \eta$,
9. $\text{rng}(a_{\eta \gamma})$ and $\text{rng}(b_{\eta \gamma})$ realize the same $k$-type, for every $k < \omega$, for a final segment of $\gamma$’s below $\eta$. Moreover they always (for each $\gamma < \eta$) realize the same 4-type.

Definition 6.4.2 (Equivalence) Let $\eta < \omega_1$ and $p, q \in P_{\leq \eta}$.

Set $p \leftrightarrow q$ iff the following hold...

158
1. the sets of $\kappa_{\gamma}$’s for $\gamma < \eta$ determined by $p$ and by $q$ are the same. Denote this set by $X$ and let $Y = \{\gamma < \eta \mid \kappa_{\gamma} \in X\}$. Clearly both $X$ and $Y$ are finite.

2. If $Y = \emptyset$, then $p \leftrightarrow_{\eta} q$ as in Definition 6.4.1.

3. If $Y \neq \emptyset$, then
   
   (a) $p_{\leq \text{min}(Y)} \leftrightarrow_{\text{min}(Y)} q_{\leq \text{min}(Y)}$,
   
   (b) $p_{> \text{max}(Y)} \leftrightarrow_{\eta} q_{> \text{max}(Y)}$,
   
   (c) $(p_{\leq \gamma})_{> \beta} \leftrightarrow_{\gamma} (q_{\leq \gamma})_{> \beta}$, for any two successive elements $\beta < \gamma$ of $Y$.

**Definition 6.4.3** (Main order of $\mathcal{P}_{\leq \eta}$) Let $\eta < \omega_1$ and $p, q \in \mathcal{P}_{\leq \eta}$.

Set $p \rightarrow_{\eta} q$ iff there exists a finite sequence $\langle r_i \mid i \leq k \rangle$ of elements of $\mathcal{P}_{\leq \eta}$ such that

1. $p = r_0$,  
2. $q = r_k$,  
3. for every $i < k$ either
   
   $r_i \leq r_{i+1}$  
   
   or  
   
   $r_i \leftrightarrow_{\eta} r_{i+1}$.

**Definition 6.4.4** (Main order) Let $p, q \in \mathcal{P}$. We set $p \rightarrow q$ iff either

1. $p \leq q$  
   
   or  
   
   2. there is $\eta < \omega_1$ such that $\kappa_{\eta}$ is determined the same way in both $p, q$ and the following hold:

   (a) $p_{> \eta} \leq q_{> \eta}$.

   It means that nothing new, not taken into account by “\leq”, happen above level $\eta$.

   (b) $p_{\leq \eta} \rightarrow_{\eta} q_{\leq \eta}$.

The next lemma insures that $\langle \mathcal{P}, \rightarrow \rangle$ is a nice subforcing of $\langle \mathcal{P}, \leq \rangle$, i.e. every dense open set in $\langle \mathcal{P}, \rightarrow \rangle$ generates such a set in $\langle \mathcal{P}, \leq \rangle$. The proof is similar to the corresponding lemma of [4, Sec. 5].
Lemma 6.4.5 Suppose that $p \rightarrow q \leq q'$ then there is $p' \geq p$ such that $q' \rightarrow p'$, where $p, q, q', p' \in \mathcal{P}$.

Lemma 6.4.6 The following hold in $V^{(\mathcal{P}, \rightarrow)}$, for every limit $\eta < \omega_1$:

- $2^{\kappa_{\eta}} \geq (\kappa_{\eta}^{+\omega+2})^V$
- If $i \in S$, then $2^{\kappa_{\eta}} \geq (\kappa_{\eta}^{+\omega+3})^V$.

Note that actually all the cardinals in the interval $[\kappa_{\eta}^{++}, \kappa_{\eta}^{+\omega+1}]$ are collapsed to $\kappa_{\eta}^+$ which itself is preserved as the successor of a singular.

Lemma 6.4.7 Let $\eta < \omega_1$. If $\eta \not\in S$ then, in $V^{(\mathcal{P}, \rightarrow)}$, $2^{\kappa_{\eta}} \leq (\kappa_{\eta}^{+\omega+2})^V$.

Proof. Just the forcing splits into $\mathcal{P}_{>\eta}$, which is $\kappa_{\eta}^+$ closed, and into $\mathcal{P}_{\leq \eta}$. Formally the cardinality of $\mathcal{P}_{\leq \eta}$ is $\kappa_{\eta}^{+\omega+3}$, but actually the forcing $\langle \mathcal{P}_{\leq \eta}, \rightarrow \rangle$ produces $\eta$-sequences indexed only by $\kappa_{\eta}^{+\omega+2}$, since $\eta \not\in S$. The formal argument is given below.

Let $M \prec H(\chi)$, for $\chi$ big enough, containing all the relevant information such that

- $|M| = \kappa_{\eta}^{+\omega+2}$,
- $M \cap \kappa_{\eta}^{+\omega+3}$ is an ordinal,
- $M$ is closed under $\kappa_{\eta}^{+\omega+1}$ sequences of its elements.

Let $p \in \mathcal{P}_{\leq \eta}$. Then, using elementarity there will be a condition $p^M \in M \cap \mathcal{P}_{\leq \eta}$ such that $p \leftrightarrow_{\eta} p^M$ and even $p \upharpoonright \kappa_{\eta}^{+\omega+2} = p^M \upharpoonright \kappa_{\eta}^{+\omega+2}$. This means that $\langle \mathcal{P}_{\leq \eta}, \rightarrow \rangle$ and $\langle \mathcal{P}_{\leq \eta} \cap M, \rightarrow \rangle$ are just the same from forcing point of view. But $|\mathcal{P}_{\leq \eta} \cap M| = \kappa_{\eta}^{+\omega+2}$.

\[\square\]

Our next task will be to show $\kappa_{\eta}^{+\omega+2}$-c.c. of the forcing $\langle \mathcal{P}_{\leq \eta}, \rightarrow \rangle$ in $V^{\mathcal{P}'}$ for each $\eta < \omega_1$.

Lemma 6.4.8 (Chain condition lemma) Suppose that $\eta < \omega_1$ and the value of $\kappa_{\eta}$ is decided. Then, in $V^{\mathcal{P}'}$, $\langle \mathcal{P}_{\leq \eta}, \rightarrow \rangle$ satisfies $\kappa_{\eta}^{+\omega+2}$-c.c.

Proof. Let us describe two cases that differ in the present setting due to Definition 6.3.1 (16-18). Let $\alpha, \beta, \gamma$ be as in Definition 6.3.1 (16-18).

Suppose first that $\eta = \beta$. We run the usual argument and let $\alpha = \beta_n$ such that the goodness of conditions at level $\alpha$ and up allows to put them together. For each $m < n$ a non-direct extension should be made at level $\beta_m$.
Suppose now $\eta = \gamma$. Then we use the fact that models of larger cardinality should be put together. Note that the assignment function need not be one to one here, but it is not a problem since we have a separation of small models (on which it can be not one to one) by models of large cardinality.

Work in $V_P'$.

Let us deal first with $\eta \notin S$. If $\eta \in S$, then the argument is very similar but with ordinals replaced by models.

If $\eta = \eta' + 1$, then we decide $\kappa_{\eta'}$. The forcing $\langle P_{\eta}, \to_{\eta} \rangle$ will be then consists of two parts $P_{\eta'}$ and a part isomorphic to the Cohen forcing for adding subsets to $\kappa_{\eta}^+$. As in Lemma 6.4.7, $P_{\eta'}$ is equivalent to a forcing of small cardinality, and so we are done.

Assume now that $\eta$ is a limit ordinal.

Let $\langle p_\tau \mid \tau < \kappa_{\eta}^{+\omega+2} \rangle$ be a sequence of elements of $P_{\leq \eta}$ and

$$p_\tau = \langle \langle \xi, p_\xi^\tau \rangle \mid \xi \in s_\tau \rangle, \langle A_\tau \mid \alpha < \eta \rangle, \langle a_\tau \gamma \beta, f_\tau \gamma \beta \mid \beta < \gamma \leq \eta \rangle, \langle a_\delta^\tau, f_\delta^\tau \mid \alpha < \beta \leq o_{\vec{E}}(\delta), \delta < \kappa_{\eta} \rangle$$

We may assume without loss of generality that $p_\tau$'s are of this form, since the number of possibilities for low parts is small and so they may be assumed to be the same and then just ignored since then the incompatibility if occurs will be due to the upper parts of the conditions.

Shrinking and replacing by $\langle \to_{\eta} \rangle$ if necessary, we can assume that the following hold:

1. $A_\tau \alpha = A_{\tau'} \alpha$ for each $\tau, \tau' < \kappa_{\eta}^{+\omega+2}$ and $\alpha < \eta$,
2. $\langle s_\tau \mid \tau < \kappa_{\eta}^{+\omega+2} \rangle$ form a $\Delta$-system with a kernel $s$,
3. $s_\tau, s_{\tau'}$ are order isomorphic over $s$ for every $\tau, \tau' < \kappa_{\eta}^{+\omega+2}$,
4. $p_\tau^\xi = p_{\sigma_{\tau\tau'}}^\xi(\xi)$, where $\sigma_{\tau\tau'}$ is the order isomorphism between $s_\tau$ and $s_{\tau'}$,
5. $s \supseteq s_\xi \cap \kappa_{\eta}^{+\omega+1}$ for every $\xi < \kappa_{\eta}^{+\omega+2}$,
6. $\min(s_\xi \setminus s) \geq \xi$,
7. $\langle a_{\tau' \beta \alpha}, f_{\tau' \beta \alpha} \mid \alpha < \beta \leq o_{\vec{E}}(\delta), \delta < \kappa_{\eta} \rangle = \langle a_{\tau \beta \alpha}, f_{\tau \beta \alpha} \mid \alpha < \beta \leq o_{\vec{E}}(\delta), \delta < \kappa_{\eta} \rangle$, for every $\tau, \tau' < \kappa_{\eta}^{+\omega+2}$,
8. $f_{\tau \gamma \beta}$ and $f_{\tau' \gamma \beta}$ are compatible for every $\beta < \gamma \leq \eta, \tau, \tau' < \kappa_{\eta}^{+\omega+2}$,
9. \( a_{\tau \gamma \beta} = a_{\tau' \gamma \beta} \), for every \( \beta < \gamma < \eta, \tau, \tau' < \kappa^+_{\eta} \).

Note that in order to insure this we may need to pass to conditions that are \( \iff \eta \) equivalent to the original ones.

10. \( \text{rng}(a_{\tau \eta \beta}) = \text{rng}(a_{\tau' \eta \beta}), \) for every \( \beta < \eta, \tau, \tau' < \kappa^+_{\eta} \).

As in the previous item, the above may require to pass to \( \iff \eta \) equivalent conditions.

Extending, if necessary, we may assume that for every \( \tau \) if \( \nu \in s_\tau \) and \( \text{cof}(\nu) \leq \kappa^+_{\eta} \) then a closed cofinal sequence witnessing \( \text{cof}(\nu) \) is contained in \( s_\tau \). This implies \( \text{cof}(\min(s_\tau \setminus s)) \geq \kappa^+_{\eta} \). Let \( \nu_\tau = \min(s_\tau \setminus s) \) for \( \tau < \kappa^+_{\eta} \).

Let now \( \tau' < \tau < \kappa^+_{\eta} \). We would like to show compatibility of \( p_\tau \) and \( p_{\tau'} \) in \( \langle P_{\leq \eta}, \rightarrow \eta \rangle \).

We proceed similar to [3].

Let \( \ell < \omega \) and \( \gamma \) be from the final segment of \( k_\ell \). Consider \( a_{\tau \gamma \gamma}(\nu_\tau) \). It is \( k_\ell \)-good, of cofinality \( \kappa^+_{\eta} \) and, once \( \kappa_\gamma \) is determined, it will correspond to an ordinal of cofinality \( \kappa^+_{\eta} \), by Definition 6.3.1(11)). Consider \( k_{\ell - 1} \)-type that \( (\text{rng}(a_{\tau \gamma r}) \setminus a_{\tau \gamma r}(\nu_\tau)) \cup (\bigcup_{\beta < \gamma} \text{dom}(a_{\tau \gamma \beta}) \setminus a_{\tau \gamma r}(\nu_\tau)) \) realizes over \( (\text{rng}(a_{\tau \gamma r}(\nu_\tau)) \cup (\bigcup_{\beta < \gamma} \text{dom}(a_{\tau \gamma \beta}) \setminus a_{\tau \gamma r}(\nu_\tau)) \). Note that the last set is bounded in \( a_{\tau \gamma r}(\nu_\tau) \) since its size is \( \leq \kappa_{\eta} \). Realize this type below \( a_{\tau \gamma r}(\nu_\tau) \) over \( (\text{rng}(a_{\tau \gamma r}) \setminus a_{\tau \gamma r}(\nu_\tau)) \cup (\bigcup_{\beta < \gamma} \text{dom}(a_{\tau \gamma \beta}) \setminus a_{\tau \gamma r}(\nu_\tau)) \). Let \( t_\gamma \) denotes the result. Now we change \( a_{\tau \gamma r} \) in the obvious fashion by sending the part that was above \( a_{\tau \gamma r}(\nu_\tau) \) into \( t_\gamma \). This allows to combine \( a_{\tau \gamma r} \) with such changed \( a_{\tau' \gamma r} \).

The above takes care of assignment functions from the level \( \eta \). What remains is to change \( a_{\tau' \gamma \beta} \), for \( \beta < \gamma < \eta \), according to the commutativity requirements (Definition 6.3.1(9)). It can be done easily using the fact that \( a_{\tau \eta \beta}(\nu_\tau) = a_{\tau \gamma \beta}(a_{\tau \eta r}(\nu_\tau)) \), for every \( \beta < \gamma < \eta \).

See the diagram:

\[\square\]

6.5 Collapsing Successors of Singulars

In this section we describe how using supercompacts to collapse \( \kappa_i^+ \)’s one can obtain a model satisfying
The construction repeats the previous one, but instead of using the usual extender sequence, we shall use here a $\mathcal{P}_\kappa(\kappa^+)$ extender sequence of the length $\kappa^{+\omega+3}$. Let us define such a sequence. Assume that $\kappa$ is $\kappa^{+\omega+3}$–supercompact. Let $j : V \rightarrow M$ be a witnessing embedding. Define from $j$ a $\mathcal{P}_\kappa(\kappa^+)$ – extender sequence $\langle E_\tau \mid \tau < \kappa^{+\omega+3} \rangle$ of the length $\kappa^{+\omega+3}$ as follows: for every $X \subseteq \mathcal{P}_\kappa(\kappa^+) \times V_\kappa$

$$X \in E_\tau \text{ iff } \langle j'' \kappa^+, \tau \rangle \in j(X).$$

Let $N_\tau = Ult(V, E_\tau)$, $N = Ult(V, \langle E_\tau \mid \tau < \kappa^{+\omega+3} \rangle)$ and

be the corresponding diagram with embeddings defined in the usual way.

**Lemma 4.1** $i'' \kappa^+ \in N_\tau, \kappa'^+N_\tau \subseteq N_\tau, i'' \kappa^+ \in N, \kappa'^+N \subseteq N, \text{crit}(k) = \kappa^{+3}$, $H_{\kappa^{+\omega+3}} = (H_{\kappa^{+\omega+3}})^N$.

**Proof.** Just note that $i'' \kappa^+$ is represented by the function $(P, \alpha) \mapsto P$. □

The extender based Prikry forcing with such extender $\langle E_\tau \mid \tau < \kappa^{+\omega+3} \rangle$ will blow up the power of $\kappa$ to $\kappa^{+\omega+3}$ but also will collapse $\kappa^+$ to $\kappa$ changing its cofinality to $\omega$, due to the $\mathcal{P}_\kappa(\kappa^+)$ – supercompact ingredient of the extender.

Here we will use a version of Magidor extended based forcing defined in previous sections, with only change to $\mathcal{P}_\kappa(\kappa^+)$ – extenders. Thus we assume that

$$\tilde{E} = \langle E(\alpha, \beta) \mid \alpha \leq \kappa, \alpha \in \text{dom } \tilde{E}, \beta < \omega_1 \rangle$$

163
is a coherent sequence satisfying condition (a) – (c) of $\vec{E}$ of Section 1. Only in (a) we require here that $E(\alpha, \beta)$ is a $(\mathcal{P}_\alpha(\alpha^+), \alpha^{+\omega+3})$ extender, i.e one of the type considered above. Also, $E(\alpha, \beta)(\tau)$ will be now the set

$$\{X \subseteq \mathcal{P}_\alpha(\alpha^+) \times \alpha \mid (j_{E(\alpha, \beta)}''(\alpha^+), \tau) \in j_{E(\alpha, \beta)}(X)\}.$$ 

The rest of the construction is without changes. The supercompact part of the forcing will change cofinality of each $(\kappa_i^+)^V(i < \omega_1)$ to $\omega$ by adding to it a cofinal sequence of order type $i$.

### 6.6 Concluding Remarks

#### 6.6.1 Cofinality Above $\aleph_1$

We like to describe changes in the previous construction that will allow us to deal with cofinality above $\aleph_1$.

Let $\delta < \kappa$ be regular cardinal above $\aleph_1$. We replace $\omega_1$ of the previous construction by $\delta$. The main idea here is to satisfy 2.1(2.5), which states that for every $i < \delta$, $\alpha \in s$ and $k < \omega$ the set $\{j < i \mid a_{ij}(\alpha) \text{ is not } k\text{-good}\}$ is finite. With $\delta = \omega_1$ this was not problematic since then each $i$ is countable and so is a countable union of finite sets. Here the relevant $i$’s are still of countable cofinality but they may be uncountable ordinals.

The following simple observation will be crucial.

**Lemma 5.1.** Let $j < \delta$, $k \leq \omega$ and suppose that some $\rho < \kappa^{+\omega+3}$ is $k$-good in $M_j = \text{Ult}(V, E(\kappa, j))$. Let $\rho'$ be an ordinal realizing the same 3-type (in $V$) as $\rho$. Then $\rho'$ is $k$-good in $M_j$.

**Proof.** The set $A = \{\nu < \kappa \mid \nu \text{ is } k\text{-good}\}$ belongs to the ultrafilter $E(\kappa, j)(\rho)$. Since $\rho'$ realizes the same 3-tupe as $\rho$ does, $A \in E(\kappa, j)(\rho')$. But then, in $M_j$, $\rho'$ is $k$-good. \qed

So, passing to equivalent ordinals at certain level will not effect smaller levels. A typical situation in which we identify certain conditions under $\leftrightarrow$ is as follows:

- $i$ is limit, $\alpha \in s$, $\langle k_n \mid n < \omega \rangle$ a nondecreasing converging to infinity sequence and we identify each $a_{it_n}(\alpha)$ with $k_n$–equivalent to its ordinal. Then for each $j$, $i_{n+1} > j > i_n$ (for some $n < \omega$) $a_{ij}(\alpha)$ usually also will be identified with $k_n$–equivalent to its ordinal. So, if there are uncountably many $j$’s between $i_n$ and $i_{n+1}$ (and this will be certainly the case once $\delta > \omega_1$) all of them drop in their types and further identifying of such $j$’s looks problematic.

The way around this problem will be to use 5.1 and consider the types of $a_{ij}(\alpha)$’s in $M_{i_{n+1}}$. 

164
instead of $V$. Then, once $\kappa_{m+1}$ is decided, we will have enough room to identify ordinals for $j$.

The following requirement describes this situation precisely, only instead of a single $i$ we will allow finitely many such $i$'s.

$a_{ij}(\alpha)$ is $\omega$-good with probably the following exceptions: there are finitely many ordinals of countable cofinality $i^0, i^1, \ldots, i^{n-1}$ such that

1. $\delta > i^0 > i^1 > \ldots > i^{n-1}$

2. for every $j < i^0$ if $i^t_m$ is the least element of the set $\{i^t_r \mid \ell < n, r < \omega\}$ above $j$, then we require $a_{i^t_m}(\alpha)$ to be $\omega$-good in Ult$(V, E(\kappa, i^t_m))$, where $\langle i^t_r \mid r < \omega\rangle$ is the fixed $\omega$-sequence for $i^t$.

3. for every $m < n$ there is nondecreasing converging to infinity sequence of natural numbers $\langle k^m_t \mid \ell < \omega\rangle$ so that for every $j < i^0$, if $i^t$ is the least above $j$ and $i^t_m$ is the least which is at most $j$, then $a_{i^t_m}(\alpha)$ is $k^m_t$-good in Ult$(V, E(\kappa, i^t))$.

Incorporating these changes, the rest of the construction is as in the previous sections. Finally we will have model with a stationary $S \subseteq \{i < \delta \mid cf i = \omega\}$ satisfying, $2^{\kappa_i} = \kappa_i^+$ for every $i \in S$ and $2^{\kappa_i} = \kappa_i^{++}$, for every $i \in \{j < \delta \mid cf j = \omega\} \setminus S$.

6.6.2 Down to $\aleph_{\omega_1}$

Combining the present construction with the techniques for collapsing cardinals of Merimovich [16] or Segal [18] it is possible to turn $\kappa$ into $\aleph_{\omega_1}$. For $i < \omega_1$, we start collapses from $\kappa_i^{++}$ and insure by this that they will depend only on the normal measure of the extender $E(\kappa, i)$. This way the equivalence relation $\leftrightarrow$ will not effect them.

6.6.3 Other Stationary Sets

Recall that $S$ was a subset of a club. Outside of a club we are basically free. Only, as in 5.2, for each $i < \omega_1$ we need to start changes above $\kappa_i^{+\omega+5}$ in order to make the final thing work.
