

# Cyber-physical systems. History, Challenges and Expectations

ILYA LEVIN

TEL AVIV UNIVERSITY

**PESW 2017**

5<sup>th</sup> Prague Embedded Systems Workshop

June 29 – 30, 2017 | Roztoky u Prahy, Czech Republic

# Outline

- ▶ Industrial revolutions
- ▶ CPS Predecessors
- ▶ Integrating Natural and Artificial Worlds
- ▶ CPS Interdisciplinarity
- ▶ CPS vs IoT
- ▶ Two Examples of Line Seekers
- ▶ Conclusions

# FROM INDUSTRIAL TO DIGITAL SOCIETY

# CULTURE OF DIGITAL SOCIETY

# CULTURE OF INDUSTRIAL SOCIETY

# FROM INDUSTRIAL TO DIGITAL SOCIETY

# Four industrial revolutions

1-st industrial  
revolution

**MECHANIZATION**

around 1750

Mechanical  
production, using  
the power of water  
and steam

2-st industrial  
revolution

**ELECTRIFICATION**

around 1900

Centralized  
electric power  
infrastructure

3-st industrial  
revolution

**DIGITALISATION**

around 1970

Digital technology,  
enhancing  
systems'  
functioning

4-st industrial  
revolution

**COGNIFICATION**

around 2010

Everybody and  
everything is  
networked, "huge  
brain", AI  
everywhere

The 2nd industrial revolution networked the resources of power  
In the 4th industrial revolution will network the resources of  
intelligence

# COGNIFIED WASHING MACHINE

Clothes tell the washing machines how they want to be washed

# COGNIFIED TOYS

Toys more like pets

# COGNIFIED NURSING

Patients with sensors that track their bio markers can generate personalized treatments

# COGNIFIED REAL ESTATE

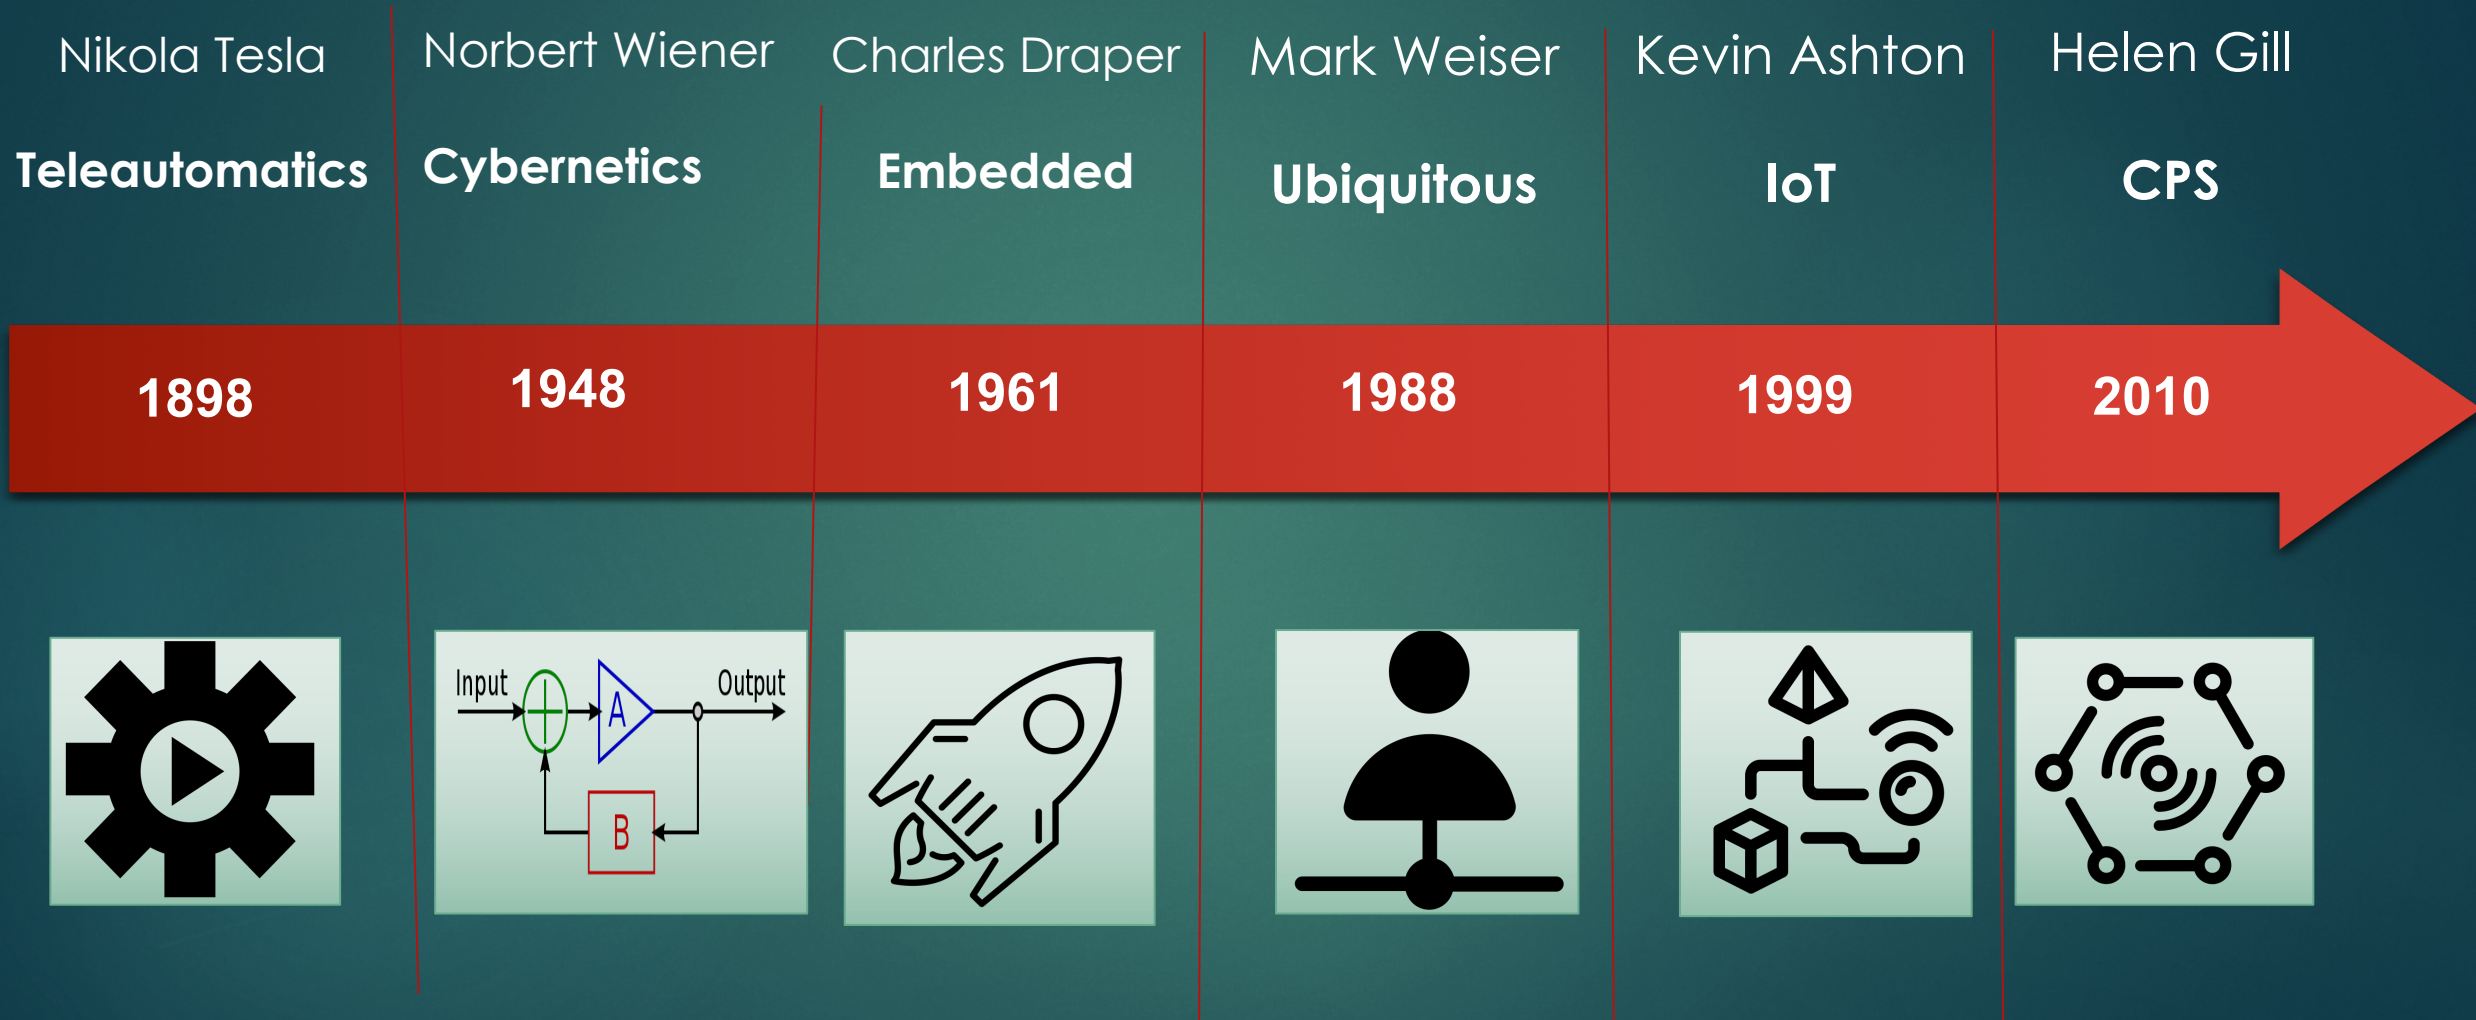

Matching buyers and sellers via AI

From teleautomation (1898) to CPS (2010)

# CPS Predecessors

# Teleautomation

When wireless is perfectly applied the whole earth will be converted into a huge brain, which in fact it is, all things being particles of a real and rhythmic whole. We shall be able to communicate with one another instantly, irrespective of distance. Not only this, but through television and telephony we shall see and hear one another as perfectly as though we were face to face, despite intervening distances of thousands of miles; and the instruments through which we shall be able to do this will be amazingly simple compared with our present telephone. A man will be able to carry one in his vest pocket.

*Nikola Tesla, 1898*

# Cyber Physical Systems

CPS are hybrid physical-engineered systems where:

1. Operations are integrated, monitored, and/or controlled by a computational core
2. Components are networked at every scale
3. Computing is embedded into every physical component, possibly even into materials
4. The computational core is an embedded system, demanding real-time response, and is often distributed

# Two Worlds coming together

## Physical World

- Natural
- Physical changes
- Real time
- Continuous
- Math: Calculus
- Closed system
- Controllable
- Predictable

## Cyber-Physical World

Hyperconnected  
World of:  
Hybrid Systems  
Embedded  
Systems

## Digital World

- Artificial
- Computations
- Computational time
- Discrete
- Math: State machine
- Open system
- Uncontrollable
- Unpredictable

Natural

Artificial

## ... and related terms: Internet of Things & Industry 4.0

Cyber-physical systems

OR

Internet of things

?

### Shared

#### Vision

- large-scale distributed computing systems of systems
- Computation and “intelligence” is not decoupled from environment

#### Core Technology

- Internet as large-scale network
- embedded systems (= intelligent components)

### Distinct

#### Scientific Community

- **Internet of Things**  
driven from computer sciences, Internet technologies  
driven by EC
- **Cyber-physical system**  
driven from engineering aspects  
driven by the NSF

#### Philosophy, focus

- **Internet of Things**  
focusing on **openness** and on the **network** - virtuality
- **Cyber-physical system**  
focusing on the **physical system** behind, often a **closed-loop system**

**For all practical purposes:**

- Today: more or less synonym
- Industry 4.0 as a special field of application

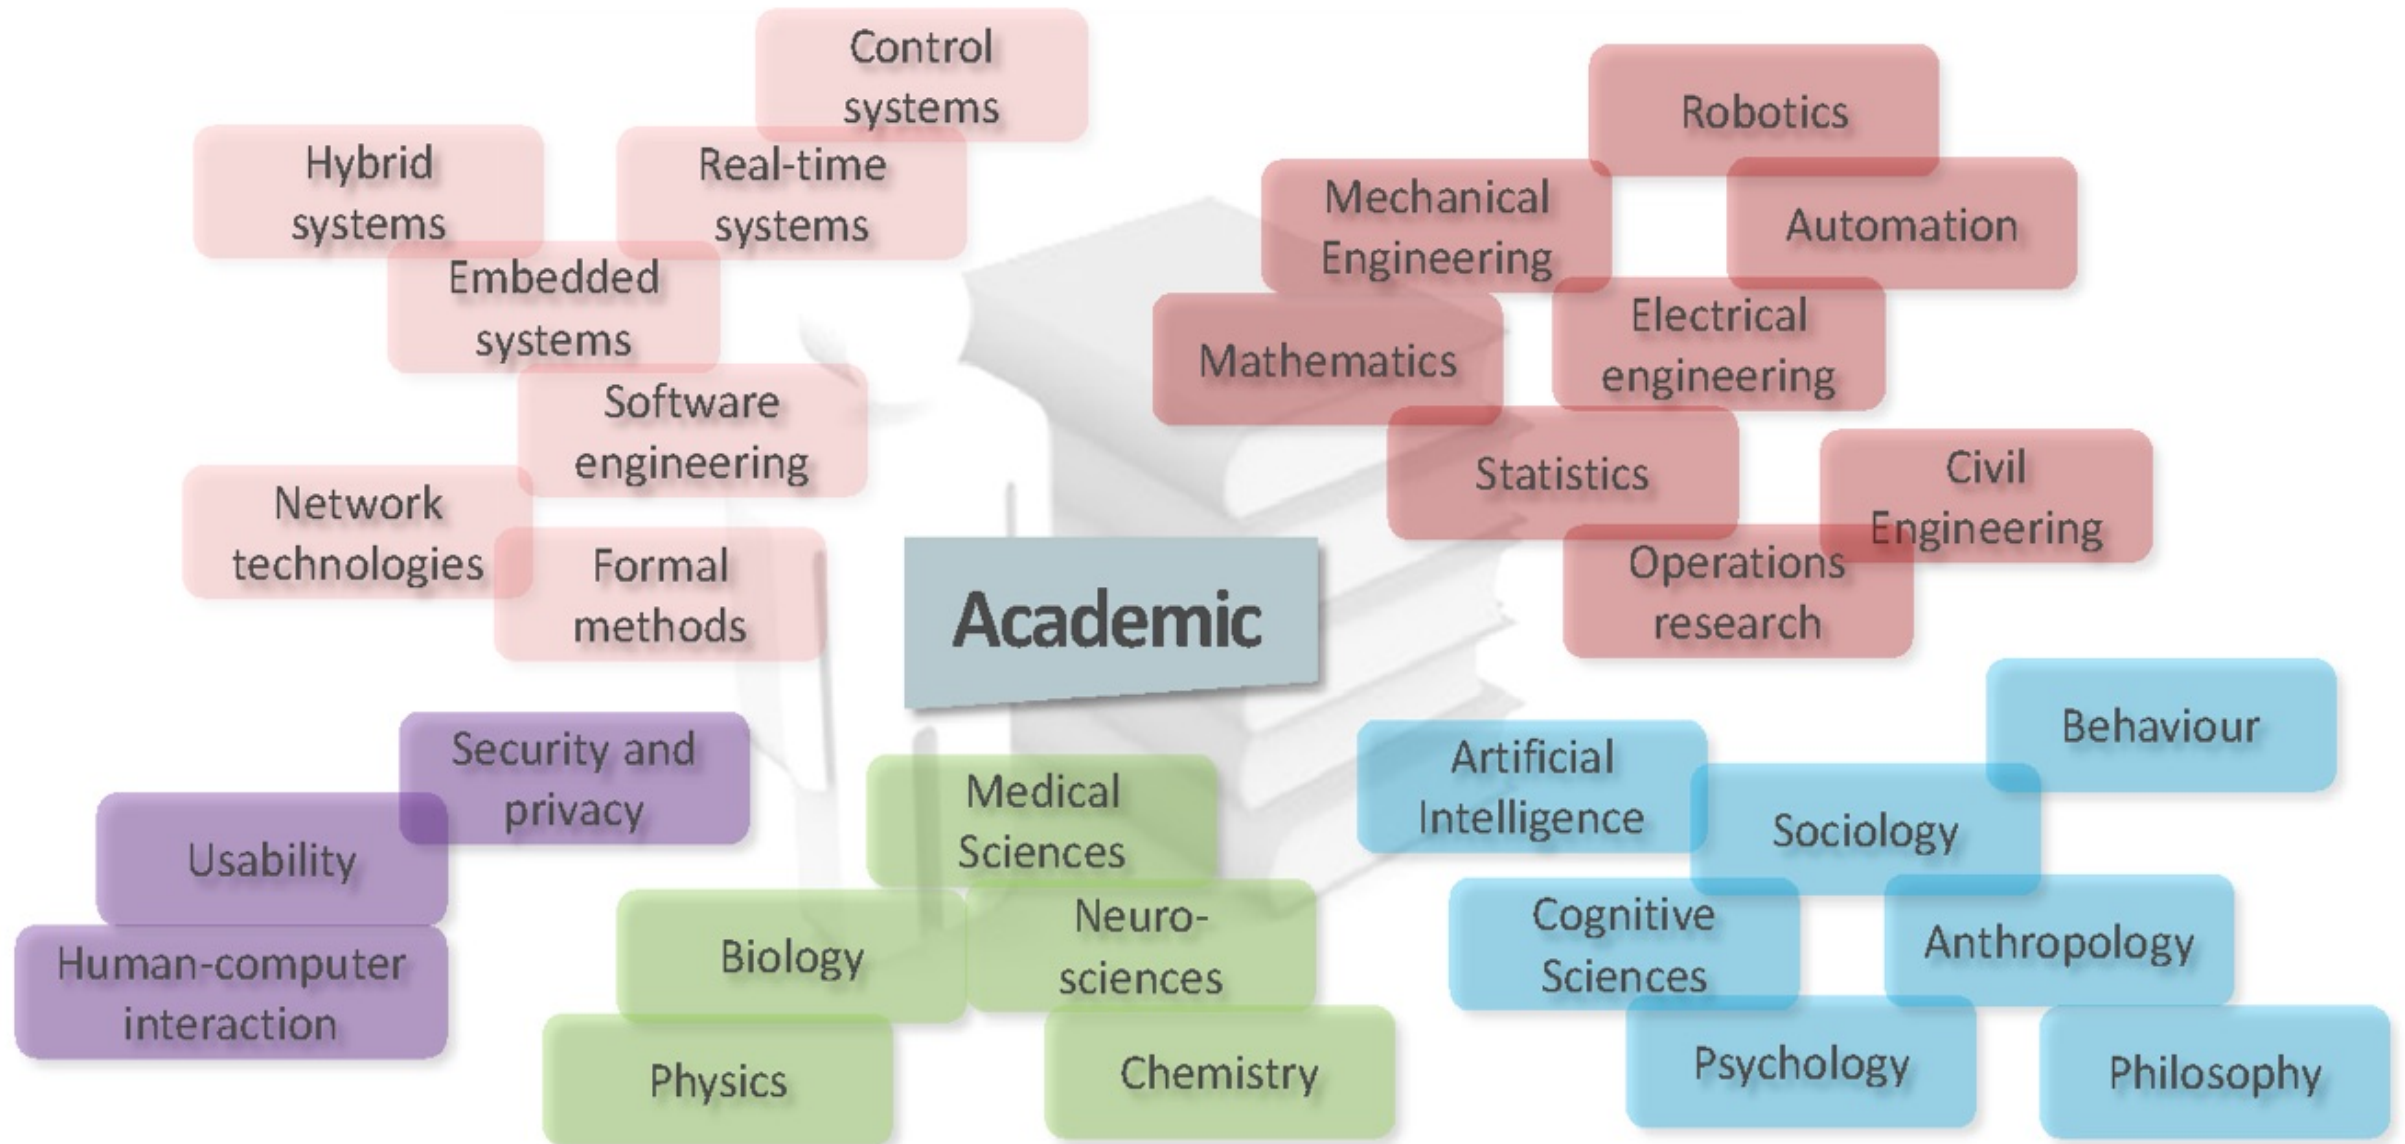

“The innovation and development of Cyber-Physical Systems will require computer scientists and network professionals to work with experts in various ...disciplines .... This, will revolutionize how universities educate engineers and scientists.”

Rajkumar, Cyber-Physical Systems: the next computing revolution, 2010

# Leading to interdisciplinary science and education

# TWO EXAMPLES: Line Seeker-1997 vs. Line Seeker-2017

# Line Seeker -1997

Fig. 2. The "line-seeker" device.

# Line seeker -1997

$x1 \Rightarrow$  sensor on?  
 $y0 \Rightarrow$  empty microcommand  
 $y1 \Rightarrow$  motor1 on  
           motor2 off  
 $y2 \Rightarrow$  motor1 off  
           motor2 on

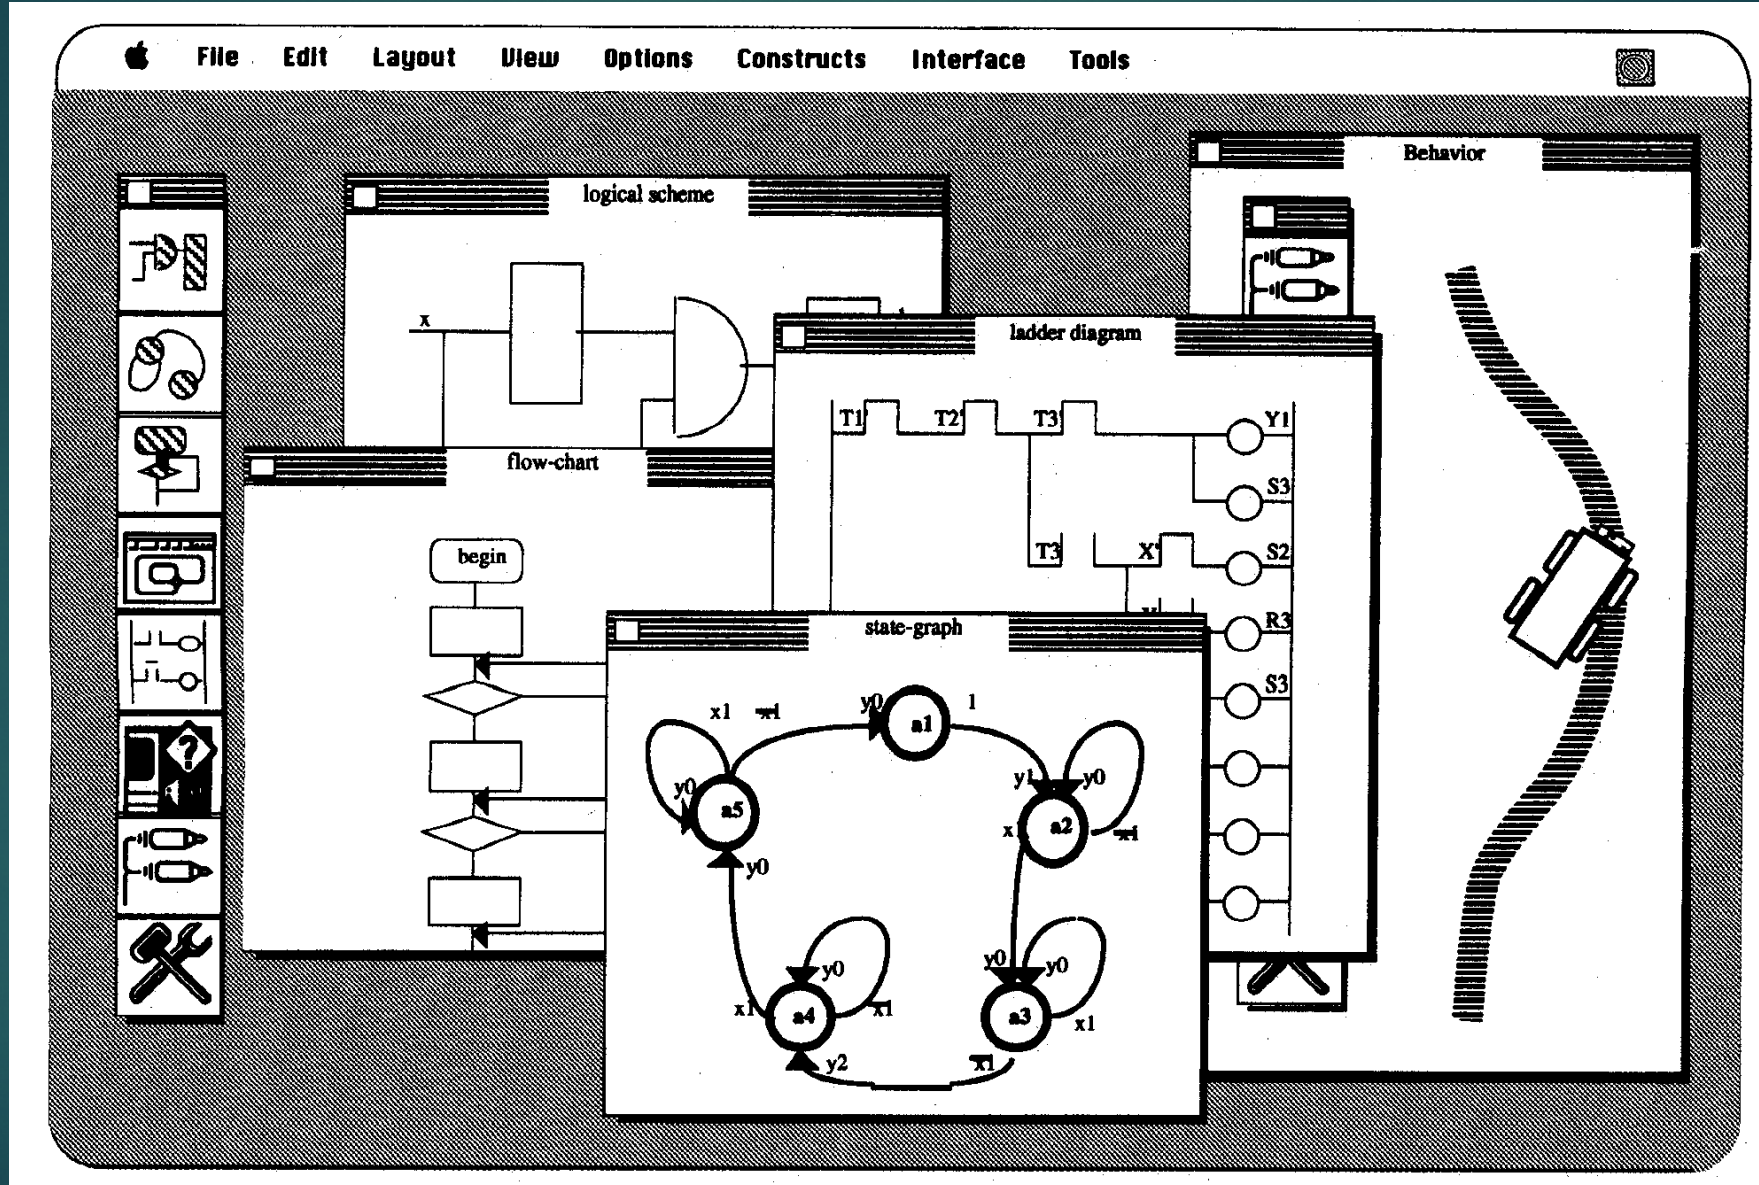

Transition table  
 $a(t+1) = \delta(a(t), x(t))$

$x \backslash a$	$a_1$	$a_2$	$a_3$	$a_4$	$a_5$
0	$a_2$	$a_3$	$a_4$	$a_4$	$a_1$
1	$a_2$	$a_2$	$a_3$	$a_5$	$a_5$

Output table  
 $y(t) = \lambda(a(t), x(t))$

$x \backslash a$	$a_1$	$a_2$	$a_3$	$a_4$	$a_5$
0	$y_1$	$y_0$	$y_2$	$y_0$	$y_0$
1	$y_1$	$y_0$	$y_0$	$y_0$	$y_0$

# Line Seeker - 1997

# Line seeker - 1997

The robot is equipped with a light sensor and motors actuators

1. The line-seeker follows the line by the sensor and a control algorithm
2. Firmware design

Line-seeker robot turns on its motor and moves from its present position to the destination according to the color under the sensor

# Line seeker - 2017

The robot is equipped with GPS sensor and communicate with the cloud

1. Line-seeker robot follows the line by using it's internal GPS sensor and a line-road map
2. The line surface updates its configuration (map) to the Web
3. High level design

1. Line-seeker robot turns on its motor and moves from its present position to the destination according to the line's map.
2. The line surface sends its configuration (map) to the Web.

# Line seeker - 2017

# Conclusions

- ▶ CPS is the main design object of the 4-th Industrial Revolution
- ▶ CPS is the Hybrid System
- ▶ CPS is communicating system
- ▶ CPS is synonym of IoT
- ▶ Design is changing significantly
- ▶ From Firmware design to Cognified System design
