PART I BACKGROUND

1. Review of some mathematical and physical subjects	3
1.1 Mathematical background	3
1.1.1 Random variables and probability distributions	3
1.1.2 Constrained extrema	7
1.1.3 Vector and fields	7
1.1.4 Continuity equation for the flow of conserved entities	10
1.1.5 Delta functions	11
1.1.6 Complex integration	13
1.1.7 Fourier and Laplace transform	14
1.1.8 The Schwarz inequality	16
1.2 Classical mechanics	17
1.2.1 Classical equations of motion	17
1.2.2 Phase space, the classical distribution function and the Liouville equation	19
1.3 Quantum mechanics	21
1.3.1 Fundamentals	21
1.3.2 Many-particle systems and the occupation number representation	23
1.4 Thermodynamics and statistical mechanics	26
1.4.1 Thermodynamics	26
1.4.2 Statistical mechanics	29
1.4.3 Quantum distributions	34
1.4.4 Coarse graining	36
1.5 Physical observables as random variables	38
1.5.1 Origin of randomness in physical systems	38
1.5.2 Joint probabilities, conditional probabilities and reduced descriptions	39
1.5.3 Random functions	41
1.5.4 Correlations	41
1.5.5 Diffusion	43
1.6 Electrostatics	45
1.6.1 Fundamental equations of electrostatics	45
1.6.2 Electrostatics in continuous dielectric media	47
1.6.3 Screening by mobile charges	52
2. Quantum dynamics using the time-dependent Schrödinger equation	56
2.1 Formal solutions	56
2.2 An example: The two-level system	58
2.3 Interacting systems: The time-dependent self-consistent field approximation and the Ehrenfest approximation	61

xiv CONTENTS

2.4 A digression on nuclear potential surfaces: The Born–Oppenheimer approximation	67
2.5 Time-dependent Hamiltonians	69
2.6 A two-level system in a time-dependent field	70
2.7 Non-adiabatic dynamics: The surface-hopping method	74
2.8 Expressing the time evolution in terms of the Green operator	75
2.9 Representations	76
2.9.1 The Schrödinger and Heisenberg representations	76
2.9.2 The interaction representation	78
2.9.3 Time-dependent perturbation theory	79
2.10 Quantum dynamics of the free particles	80
2.10.1 Free particle eigenfunctions	80
2.10.2 Free particle density of states	81
2.10.3 Time evolution of a one-dimensional free particle wavepacket	83
2.10.4 The quantum mechanical flux	85
2.11 Quantum dynamics of the harmonic oscillator	88
2.11.1 Elementary considerations	88
2.11.2 The raising/lowering operators formalism	91
2.11.3 The Heisenberg equations of motion	93
2.11.4 The shifted Harmonic oscillator	94
2.11.5 Harmonic oscillator at thermal equilibrium	99
2.12 Tunneling	100
2.12.1 Tunneling through a square barrier	100
2.12.2 Some observations	103
3. An overview of quantum electrodynamics and matter–radiation field interaction	113
3.1 Introduction	113
3.2 The quantum radiation field	115
3.2.1 Classical electrodynamics	115
3.2.2 Quantum electrodynamics	117
3.2.3 Spontaneous emission	120
3.2.4 Classical spontaneous emission	121
3.3 Spontaneous emission in confined environments: The Purcell effect	123
3.4 Light scattering	126
3.5 Photon detection	127
4. Introduction to solids	140
4.1 Lattice periodicity	140
4.2 Lattice vibrations	141
4.2.1 Normal modes of harmonic systems	141
4.2.2 Simple harmonic crystal in one dimension	143
4.2.3 Density of modes	145
4.2.4 Phonons in higher dimensions and the heat capacity of solids	147
4.3 Electronic structure of solids	150
4.3.1 The free electron theory of metals: Energetics	151
4.3.2 The free electron theory of metals: Motion	152
4.3.3 Electronic structure of periodic solids: Bloch theory	154
4.3.4 The one-dimensional tight-binding model	156
4.3.5 The nearly free particle model	159

4.3.6 Intermediate summary: Free electrons versus non-interacting electrons in a periodic potential	162
4.3.7 Further dynamical implications of the electronic band structure of solids	163
4.3.8 Semiconductors	165
4.4 The work function	170
4.5 Surface potential and screening	172
4.5.1 General considerations	172
4.5.2 The Thomas–Fermi theory of screening by metallic electrons	173
4.5.3 Semiconductor interfaces	175
4.5.4 Interfacial potential distributions	177
5. Introduction to liquids	179
5.1 Statistical mechanics of classical liquids	180
5.2 Time and ensemble average	181
5.3 Reduced configurational distribution functions	182
5.4 Observable implications of the pair correlation function	185
5.4.1 X-ray scattering	185
5.4.2 The average energy	187
5.4.3 Pressure	187
5.5 The potential of mean force and the reversible work theorem	189
5.6 The virial expansion—the second virial coefficient	190

PART II METHODS

6. Time-correlation functions	195
6.1 Stationary systems	195
6.2 Simple examples	197
6.2.1 The diffusion coefficient	197
6.2.2 Golden rule rates	199
6.3 Classical time-correlation functions	201
6.4 Quantum time-correlation functions	207
6.5 Harmonic reservoir	209
6.5.1 Classical bath	210
6.5.2 The spectral density	213
6.5.3 Quantum bath	214
6.5.4 Why are harmonic bath models useful?	215
7. Introduction to stochastic processes	218
7.1 The nature of stochastic processes	218
7.2 Stochastic modeling of physical processes	221
7.3 The random walk problem	223
7.3.1 Time evolution	223
7.3.2 Moments	225
7.3.3 The probability distribution	227
7.4 Some concepts from the general theory of stochastic processes	230
7.4.1 Distributions and correlation functions	230
7.4.2 Markovian stochastic processes	232
7.4.3 Gaussian stochastic processes	234

xvi CONTENTS

7.4.4 A digression on cumulant expansions	237
7.5 Harmonic analysis	237
7.5.1 The power spectrum	238
7.5.2 The Wiener–Khinchin theorem	239
7.5.3 Application to absorption	240
7.5.4 The power spectrum of a randomly modulated harmonic oscillator	242
7.6 Shot noise	245
8. Stochastic equations of motion	254
8.1 Introduction	254
8.2 The Langevin equation	257
8.2.1 General considerations	257
8.2.2 The high friction limit	260
8.2.3 Harmonic analysis of the Langevin equation	261
8.2.4 The absorption lineshape of a harmonic oscillator	263
8.2.5 Derivation of the Langevin equation from a microscopic model	265
8.2.6 The generalized Langevin equation	267
8.3 Master equations	270
8.3.1 The random walk problem revisited	271
8.3.2 Chemical kinetics	272
8.3.3 The relaxation of a system of harmonic oscillators	274
8.4 Counting statistics	277
8.4.1 The generating function method	278
8.4.2 The Green function method	281
8.5 The Fokker–Planck equation	283
8.5.1 A simple example	284
8.5.2 The probability flux	285
8.5.3 Derivation of the Fokker–Planck equation from the Chapman–Kolmogorov equation	286
8.5.4 Derivation of the Smoluchowski equation from the overdamped Langevin equation	288
8.5.5 Derivation of the Fokker–Planck equation from the Langevin equation	290
8.5.6 The multidimensional Fokker–Planck equation	293
8.6 Passage time distributions and the mean first passage time	293
9. Introduction to quantum relaxation processes	300
9.1 A simple quantum-mechanical model for relaxation	301
9.2 Solution in the time domain	308
9.3 The origin of irreversibility	311
9.3.1 Irreversibility reflects a restricted observation	311
9.3.2 Relaxation in isolated molecules	311
9.3.3 Spontaneous emission	312
9.3.4 Preparation of the initial state	313
9.4 The effect of relaxation on absorption lineshapes	313
9.5 The two-level system revisited	321
9.6 Relaxation of a quantum harmonic oscillator	323
9.7 Quantum mechanics of steady states	328

9.7.1 Quantum description of steady-state processes	328
9.7.2 Steady-state absorption	333
9.7.3 Resonance tunneling	333
10. The quantum mechanical density operator and its time evolution:	
Quantum dynamics using the quantum Liouville equation	343
10.1 The density operator and the quantum Liouville equation	344
10.1.1 The density matrix for a pure system	344
10.1.2 Statistical mixtures	345
10.1.3 Representations	347
10.1.4 Coherences	349
10.1.5 Thermodynamic equilibrium	350
10.2 An example: The time evolution of a two-level system in the density matrix formalism	351
10.3 Reduced descriptions	353
10.3.1 General considerations	354
10.3.2 A simple example—the quantum mechanical basis for macroscopic rate equations	357
10.4 Time evolution equations for reduced density operators: The quantum master equation	360
10.4.1 Using projection operators	361
10.4.2 The Nakajima–Zwanzig equation	362
10.4.3 Derivation of the quantum master equation using the thermal projector	364
10.4.4 The quantum master equation in the interaction representation	366
10.4.5 The Markovian limit—the Redfield equation	370
10.4.6 A pause for reflection	372
10.4.7 The secular approximation and the Lindblad equation	373
10.5 The Lindblad equation in the ‘Heisenberg representation’	378
10.6 The two-level system and the harmonic oscillator revisited	379
10.6.1 The two-level system in a thermal environment	379
10.6.2 Thermal relaxation of a harmonic oscillator	382
10.7 The optically driven two-level system in a thermal environment—the Bloch equations	384
10.8 The oscillating dipole model of a two-level molecule	387
11. Linear response theory	395
11.1 Classical linear response theory	396
11.1.1 Static response	396
11.1.2 Relaxation	397
11.1.3 Dynamic response	398
11.2 Quantum linear response theory	400
11.2.1 Static quantum response	400
11.2.2 Dynamic quantum response	402
11.3 Causality and the Kramers–Kronig relations	405
11.4 Examples: Mobility, conductivity and diffusion	406
11.5 Thermal noise	411

xviii CONTENTS

12. The spin–boson model	414
12.1 Introduction	414
12.2 The model	415
12.3 The polaron transformation	418
12.3.1 The Born–Oppenheimer picture	420
12.4 Golden-rule transition rates	423
12.4.1 The decay of an initially prepared level	423
12.4.2 The thermally averaged rate	427
12.4.3 Evaluation of rates	429
12.5 Transitions between molecular electronic states	431
12.5.1 The optical absorption lineshape	431
12.5.2 Electronic relaxation of excited molecules	434
12.5.3 The weak coupling limit and the energy gap law	435
12.5.4 The thermal activation/potential-crossing limit	436
12.5.5 Spin–lattice relaxation	438
12.6 Beyond the golden rule	440

PART III APPLICATIONS

13. Vibrational energy relaxation	445
13.1 General observations	445
13.2 Construction of a model Hamiltonian	448
13.3 The vibrational relaxation rate	451
13.4 Evaluation of vibrational relaxation rates	454
13.4.1 The bilinear interaction model	454
13.4.2 Nonlinear interaction models	457
13.4.3 The independent binary collision (IBC) model	458
13.4.4 Multi-phonon theory of vibrational relaxation	460
13.5 Effect of supporting modes	465
13.6 Numerical simulations of vibrational relaxation	467
13.7 Concluding remarks	469
14. Chemical reactions in condensed phases	471
14.1 Introduction	471
14.2 Unimolecular reactions	472
14.3 Transition state theory (TST)	475
14.3.1 Foundations of transition state theory	475
14.3.2 Transition state rate of escape from a one-dimensional well	477
14.3.3 Transition rate for a multidimensional system	478
14.3.4 Some observations	481
14.3.5 TST for non-adiabatic transitions	483
14.3.6 TST with tunneling	485
14.4 Dynamical effects in barrier crossing—the Kramers model	485
14.4.1 Escape from a one-dimensional well	486
14.4.2 The overdamped case	488
14.4.3 Moderate-to-large damping	491
14.4.4 The low damping limit	493
14.5 Observations and extensions	497
14.5.1 Implications and shortcomings of the Kramers theory	497

14.5.2 Non-Markovian effects	500
14.5.3 The normal mode representation	502
14.6 Some experimental observations	503
14.7 Numerical simulation of barrier crossing	506
14.8 Diffusion-controlled reactions	509
15. Solvation dynamics	517
15.1 Dielectric solvation	517
15.2 Solvation in a continuum dielectric environment	519
15.2.1 General observations	519
15.2.2 Dielectric relaxation and the Debye model	520
15.3 Linear response theory of solvation	523
15.4 More aspects of solvation dynamics	526
15.5 Quantum solvation	528
16. Electron transfer processes	531
16.1 Introduction	531
16.2 A primitive model	533
16.3 Continuum dielectric theory of electron transfer processes	536
16.3.1 The problem	536
16.3.2 Equilibrium electrostatics	537
16.3.3 Transition assisted by dielectric fluctuations	538
16.3.4 Thermodynamics with restrictions	539
16.3.5 Dielectric fluctuations	539
16.3.6 Energetics of electron transfer between two ionic centers	543
16.3.7 The electron transfer rate	546
16.4 A molecular theory of the non-adiabatic electron transfer rate	546
16.5 Comparison with experimental results	549
16.6 Solvent-controlled electron transfer dynamics	551
16.7 A general expression for the dielectric reorganization energy	554
16.8 The Marcus parabolas	555
16.9 Harmonic field representation of the dielectric response	557
16.10 The non-adiabatic coupling	561
16.11 The distance dependence of electron transfer rates	563
16.12 Bridge-mediated long-range electron transfer	564
16.13 Electron transport by hopping	568
16.14 Proton transfer	573
17. Electron transfer and transmission at molecule–metal and molecule–semiconductor interfaces	578
17.1 Electrochemical electron transfer	578
17.1.1 Introduction	578
17.1.2 The electrochemical measurement	580
17.1.3 The electron transfer process	581
17.1.4 The nuclear reorganization	584
17.1.5 Dependence on the electrode potential: Tafel plots	584
17.1.6 Electron transfer at the semiconductor–electrolyte interface	586
17.2 Molecular conduction	588
17.2.1 Electronic structure models of molecular conduction	588

XX CONTENTS

17.2.2	Conduction of a molecular junction	590
17.2.3	The bias potential	593
17.2.4	The one-level bridge model	595
17.2.5	A bridge with several independent levels	597
17.2.6	Experimental statistics	599
17.2.7	The tight-binding bridge model	601
17.3	A formal theory of molecular conduction and current noise	605
17.3.1	Electronic junction dynamics in occupation number representation	605
17.3.2	Steady-state current in the one-level bridge model	605
17.3.3	Current noise in the one-level bridge model	611
18.	Spectroscopy	617
18.1	Introduction	617
18.2	Molecular spectroscopy in the dressed state picture	620
18.3	Resonance Raman scattering	626
18.4	Resonance energy transfer	630
18.5	Collective excitation and emission	637
18.6	Thermal relaxation and dephasing	641
18.6.1	The Bloch equations	641
18.6.2	Relaxation of a prepared state	642
18.6.3	Dephasing (decoherence)	643
18.6.4	The absorption lineshape	643
18.6.5	Homogeneous and inhomogeneous broadening	644
18.6.6	Motional narrowing	646
18.6.7	Thermal effects in resonance Raman scattering	650
18.6.8	A case study: Resonance Raman scattering and fluorescence from azulene in a naphthalene matrix	653
18.7	Probing inhomogeneous bands	657
18.7.1	Hole-burning spectroscopy	657
18.7.2	Photon echoes	659
18.7.3	Single-molecule spectroscopy	663
18.8	Optical response functions	665
18.8.1	The Hamiltonian	666
18.8.2	Response functions at the single-molecule level	666
18.8.3	Many-body response theory	669
18.8.4	Independent particles	671
18.8.5	Linear response	672
18.8.6	Linear response theory of propagation and absorption	674
19.	Molecular spectroscopy at dielectric interfaces	680
19.1	Electrodynamics at metal interfaces	682
19.2	Plasmons	683
19.3	Cavity modes	690
19.4	Resonance interaction in the oscillating dipoles model	692
19.4.1	The local field	694
19.4.2	Relaxation rates	697

CONTENTS xxi

19.4.3 Raman scattering	699
19.4.4 Resonance energy transfer	701
19.5 Strong coupling	702
19.6 More on radiative and non-radiative decay rates	705
19.7 Collective effects	710
<i>Index</i>	720
